[24032] It is appreciated that VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM550 host target genes. The mRNA of each one of this plurality of VGAM550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM550 RNA, herein designated VGAM RNA, and which when bound by VGAM550 RNA causes inhibition of translation of respective one or more VGAM550 host target proteins.

[24033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM550 gene, herein designated VGAM GENE, on one or more VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24034] It is yet further appreciated that a function of VGAM550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 2-1. Specific functions, and accordingly utilities, of VGAM550 correlate with, and may be deduced from, the identity of the host target genes which VGAM550 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24035] Nucleotide sequences of the VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM550 are further described hereinbelow with reference to Table 1.

[24036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM550 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM550 gene, herein designated VGAM is inhibition of expression of VGAM550 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM550 correlate with, and may be deduced from, the identity of the target genes which VGAM550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24038] Carnitine O-octanoyltransferase (CROT, Accession NM\_021151) is a VGAM550 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22124, to the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24039] A function of VGAM550 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM\_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT. The function of CROT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM70. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860) is another VGAM550 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL3 BINDING SITE, designated SEQ ID:12472, to the nucleotide se-

quence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24040] Another function of VGAM550 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL3. The function of FSTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Glutamic-oxaloacetic Transaminase 1, Soluble (aspartate aminotransferase 1) (GOT1, Accession NM\_002079) is another VGAM550 host target gene. GOT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOT1 BINDING SITE, designated SEQ ID:7867, to the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24041] Another function of VGAM550 is therefore inhibition of

Glutamic-oxaloacetic Transaminase 1, Soluble (aspartate aminotransferase 1) (GOT1, Accession NM\_002079), a gene which reversibly transfers amino group from aspartate to 2-oxoglutarate to form oxaloacetate and glutamate. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOT1. The function of GOT1 has been established by previous studies. Glutamate oxaloacetate transaminase (EC 2.6.1.1) is a ubiquitous pyridoxal phosphate-dependent enzyme which exists in both mitochondrial (OMIM Ref. No. 138150) and cytosolic forms. The enzyme plays an important role in amino acid metabolism and in the urea and tricarboxylic acid cycles. The 2 isoenzymes are homodimeric. In liver about 80% of the enzyme activity is mitochondrial in origin, whereas in serum the enzyme activity is largely cytosolic. Although the mitochondrial and soluble forms of GOT are coded by different chromosomes (according to a rule that has few exceptions; McKusick, 1986), the 2 show close homology in amino acid sequence and were presumably derived from a common ancestral gene (Ford et al., 1980; Doonan et al., 1984). Panteghini (1990) reviewed the clinical usefulness of assays for aspartate aminotransferase (AST)

isoenzymes in serum. By analysis of mouse–human somatic cell hybrids, Creagan et al. (1973) concluded that the structural locus for cytoplasmic glutamate oxaloacetate transaminase is on chromosome 10. Spritz et al. (1979) studied soluble GOT activity in fibroblasts of 2 persons with duplications of the long arm of chromosome 10. Since the 2 differed by only half a band, the authors concluded that the structural locus is on band 10q24. Koch et al. (1981) pointed out that GOT1 and LIPA (OMIM Ref. No. 278000) are also syntenic on chromosome 19 of the mouse. Junien et al. (1982) assigned GOT1 and PGAMA (OMIM Ref. No. 172250) to 10q26.1 (or 10q25.3) by dosage studies. Pol et al. (1988) cloned cDNAs corresponding to human liver cytosolic and mitochondrial aspartate aminotransferase mRNAs. Pol et al. (1989) used these cDNA probes to locate the GOT1 gene in the region 10q24.1–q25.1 by in situ hybridization. Wang et al. (1999) located the GOT1 gene within the critical region for the urofacial syndrome (OMIM Ref. No. 236730), between markers D10S198 and D10S2494, but excluded it as a candidate for that disorder by mutation analysis.

[24042] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [24043] McKusick, V. A. : The morbid anatomy of the human genome: a review of gene mapping in clinical medicine (part 1). Medicine 65: 1-33, 1986. ; and
- [24044] Wang, C.-Y.; Huang, Y.-Q.; Shi, J.-O.; Marron, M. P.; Ruan, Q.-G.; Hawkins-Lee, B.; Ochoa, B.; She, J.-X. : Genetic homogeneity, high-resolution mapping, and mutation analysis of the u.
- [24045] Further studies establishing the function and utilities of GOT1 are found in John Hopkins OMIM database record ID 138180, and in cited publications numbered 11913-11914, 2988, 11915-11917, 11921, 11927-11929, 1882, 378 and 11930-11934 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Stress 70 Protein Chaperone, Microsome-associated, 60kDa (STCH, Accession NM\_006948) is another VGAM550 host target gene. STCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STCH BINDING SITE, designated SEQ ID:13836, to the nu-

cleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24046] Another function of VGAM550 is therefore inhibition of Stress 70 Protein Chaperone, Microsome-associated, 60kDa (STCH, Accession NM\_006948), a gene which has peptide-independent atpase activity. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STCH. The function of STCH has been established by previous studies. The stress-70 chaperone family consists of proteins that bind to denatured or incorrectly folded polypeptides and play a major role in the processing of cytosolic and secretory proteins. Otterson et al. (1994) cloned a human cDNA encoding a predicted 471-amino acid protein (60 kD) which they designated STCH. Brodsky et al. (1995) stated that the protein sequence is very similar to that of HSP70 (OMIM Ref. No. 140550) and BiP (OMIM Ref. No. 138120). As with other members of the family, the STCH protein contains an ATPase domain at the amino terminus whose activity was shown to be independent of peptide stimulation. The protein was found to be microsome-associated and constitutively expressed in all cell types examined. Brodsky et al. (1995) mapped the

STCH gene to chromosome 21q11.1 with a high-resolution somatic cell hybrid panel for chromosome 21 and by fluorescence in situ hybridization with a YAC containing the gene. By interspecific backcross analysis, Reeves et al. (1998) mapped the mouse Stch gene to chromosome 16.

[24047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24048] Brodsky, G.; Otterson, G. A.; Parry, B. B.; Hart, I.; Patterson, D.; Kaye, F. J. : Localization of STCH to human chromosome 21q11.1. Genomics 30: 627–628, 1995. ; and

[24049] Otterson, G. A.; Flynn, G. C.; Kratzke, R. A.; Coxon, A.; Johnston, P. G.; Kaye, F. J. : Stch encodes the 'ATPase core' of a microsomal stress70 protein. EMBO J. 13: 1216–1225, 1994.

[24050] Further studies establishing the function and utilities of STCH are found in John Hopkins OMIM database record ID 601100, and in cited publications numbered 9629–9631 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM\_098859) is another VGAM550 host target gene. C9orf14 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C9orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf14 BINDING SITE, designated SEQ ID:41911, to the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24051] Another function of VGAM550 is therefore inhibition of Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM\_098859). Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf14. DKFZp547A023 (Accession XM\_052065) is another VGAM550 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35944, to the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24052] Another function of VGAM550 is therefore inhibition of DKFZp547A023 (Accession XM\_052065). Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. 5-hydroxytryptamine (serotonin) Receptor 3A (HTR3A, Accession NM\_000869) is another VGAM550 host target gene. HTR3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR3A BINDING SITE, designated SEQ ID:6537, to the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, also designated SEQ ID:3261.

[24053] Another function of VGAM550 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 3A (HTR3A, Accession NM\_000869). Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR3A. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 551

(VGAM551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24054] VGAM551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM551 was detected is described hereinabove with reference to Figs. 1–8.

[24055] VGAM551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 2–1. VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24056] VGAM551 gene encodes a VGAM551 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM551 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM551 precursor RNA is designated SEQ ID:537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:537 is located at position 3584 relative to the genome of Leishmania RNA Virus 2–1.

[24057] VGAM551 precursor RNA folds onto itself, forming

VGAM551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24058] An enzyme complex designated DICER COMPLEX, `dices` the VGAM551 folded precursor RNA into VGAM551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM551 RNA is designated SEQ ID:3262, and is provided hereinbelow with reference to the sequence listing part.

[24059] VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM551 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24060] VGAM551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM551 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24061] The complementary binding of VGAM551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM551 host target RNA into VGAM551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24062] It is appreciated that VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM551 host target genes. The mRNA of each one of this plurality of VGAM551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM551 RNA, herein designated VGAM RNA, and which when bound by VGAM551 RNA causes inhibition of translation of respective one or more VGAM551 host target proteins.

[24063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM551 gene, herein designated VGAM GENE, on one or more VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24064] It is yet further appreciated that a function of VGAM551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 2-1. Specific functions, and accordingly utilities, of VGAM551 correlate with, and may be deduced from, the identity of the host target genes which VGAM551 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[24065] Nucleotide sequences of the VGAM551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM551 are further described hereinbelow with reference to Table 1.

[24066] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM551 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24067] As mentioned hereinabove with reference to Fig. 1, a function of VGAM551 gene, herein designated VGAM is inhibition of expression of VGAM551 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM551 correlate with, and may be deduced from, the identity of the target genes which VGAM551 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[24068] Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759) is a VGAM551 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9840, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24069] A function of VGAM551 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222. Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714) is another

VGAM551 host target gene. C20orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf13 BINDING SITE, designated SEQ ID:19300, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24070] Another function of VGAM551 is therefore inhibition of Chromosome 20 Open Reading Frame 13 (C20orf13, Accession NM\_017714). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf13. DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM\_028966) is another VGAM551 host target gene. DNAJC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:30813, to the nucleotide sequence of VGAM551 RNA,

herein designated VGAM RNA, also designated SEQ ID:3262.

[24071] Another function of VGAM551 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM\_028966). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5. FLJ10737 (Accession NM\_018198) is another VGAM551 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:20067, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24072] Another function of VGAM551 is therefore inhibition of FLJ10737 (Accession NM\_018198). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. FLJ20079 (Accession NM\_017656) is another VGAM551 host target gene. FLJ20079 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19167, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24073] Another function of VGAM551 is therefore inhibition of FLJ20079 (Accession NM\_017656). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ32499 (Accession NM\_144607) is another VGAM551 host target gene. FLJ32499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32499 BINDING SITE, designated SEQ ID:29422, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24074] Another function of VGAM551 is therefore inhibition of

FLJ32499 (Accession NM\_144607). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32499. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_021903) is another VGAM551 host target gene. GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABBR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABBR1 BINDING SITE1 and GABBR1 BINDING SITE2, designated SEQ ID:22426 and SEQ ID:7208 respectively, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24075] Another function of VGAM551 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM\_021903). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. Nuclear Receptor Subfamily 4, Group A, Member 3 (NR4A3, Accession NM\_006981) is another VGAM551 host target gene. NR4A3 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by NR4A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A3 BINDING SITE, designated SEQ ID:13844, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24076] Another function of VGAM551 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 3 (NR4A3, Accession NM\_006981). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A3. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469) is another VGAM551 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25528, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA,

also designated SEQ ID:3262.

[24077] Another function of VGAM551 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC128989 (Accession XM\_059310) is another VGAM551 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36946, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24078] Another function of VGAM551 is therefore inhibition of LOC128989 (Accession XM\_059310). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC149276 (Accession XM\_097621) is another VGAM551 host target gene. LOC149276 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40975, to the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, also designated SEQ ID:3262.

[24079] Another function of VGAM551 is therefore inhibition of LOC149276 (Accession XM\_097621). Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 552 (VGAM552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24080] VGAM552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM552 was detected is described hereinabove with reference to Figs. 1–8.

[24081] VGAM552 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Adenovirus D. VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24082] VGAM552 gene encodes a VGAM552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM552 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM552 precursor RNA is designated SEQ ID:538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:538 is located at position 980 relative to the genome of Human Adenovirus D.

[24083] VGAM552 precursor RNA folds onto itself, forming VGAM552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24084] An enzyme complex designated DICER COMPLEX, `dices` the VGAM552 folded precursor RNA into VGAM552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM552 RNA is designated SEQ ID:3263, and is provided hereinbelow with reference to the sequence listing part.

[24085] VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM552 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24086] VGAM552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM552 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24087] The complementary binding of VGAM552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM552 host tar-

get RNA into VGAM552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24088] It is appreciated that VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM552 host target genes. The mRNA of each one of this plurality of VGAM552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM552 RNA, herein designated VGAM RNA, and which when bound by VGAM552 RNA causes inhibition of translation of respective one or more VGAM552 host target proteins.

[24089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM552 gene, herein designated VGAM GENE, on one or more VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24090] It is yet further appreciated that a function of VGAM552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM552 correlate with, and may be deduced from, the identity of the host target genes which VGAM552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24091] Nucleotide sequences of the VGAM552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM552 are further

described hereinbelow with reference to Table 1.

[24092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM552 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24093] As mentioned hereinabove with reference to Fig. 1, a function of VGAM552 gene, herein designated VGAM is inhibition of expression of VGAM552 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM552 correlate with, and may be deduced from, the identity of the target genes which VGAM552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24094] Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160) is a VGAM552 host target gene. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:6829 and SEQ ID:14868 respectively, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24095] A function of VGAM552 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of APAF1 has been established by previous studies.

Metastatic melanoma is a deadly cancer that fails to respond to conventional chemotherapy. Mutations in p53 (OMIM Ref. No. 191170) often occur in aggressive and chemoresistant cancers but are rarely observed in melanoma. Soengas et al. (2001) showed that metastatic melanomas often lose APAF1. Loss of APAF1 expression was accompanied by allelic loss in metastatic melanomas, but could be recovered in melanoma cell lines by treatment with the methylation inhibitor 5-aza-2-prime-deoxycytidine (5aza2dC). APAF1-negative

melanomas were invariably chemoresistant and were unable to execute a typical apoptotic program in response to p53 activation. Restoring physiologic levels of APAF1 through gene transfer or 5aza2dC treatment markedly enhanced chemosensitivity and rescued the apoptotic defects associated with APAF1 loss. Soengas et al. (2001) concluded that APAF1 is inactivated in metastatic melanomas, leading to defects in the execution of apoptotic cell death. Animal model experiments lend further support to the function of APAF1. Yoshida et al. (1998) also produced Apaf1-deficient mice which exhibited reduced apoptosis in the brain and striking craniofacial abnormalities with hyperproliferation of neuronal cells. Apaf1-deficient cells were resistant to a variety of apoptotic stimuli, and the processing of caspases-2, -3, and -8 was impaired. However, both Apaf1 -/- thymocytes and activated T lymphocytes were sensitive to Fas-induced killing, showing that Fas-mediated apoptosis in these cells is independent of Apaf1. These data indicated that Apaf1 plays a central role in the common events of mitochondria-dependent apoptosis in most death pathways and that this role is critical for normal development.

[24096] It is appreciated that the abovementioned animal model

for APAF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[24097] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24098] Soengas, M. S.; Capodieci, P.; Polsky, D.; Mora, J.; Esteller, M.; Opitz-Araya, X.; McCombie, R.; Herman, J. G.; Gerald, W. L.; Lazebnik, Y. A.; Cordon-Cardo, C.; Lowe, S. W. : In-activation of the apoptosis effector Apaf-1 in malignant melanoma. Nature 409: 207-211, 2001. ; and

[24099] Yoshida, H.; Kong, Y.-Y.; Yoshida, R.; Elia, A. J.; Hakem, A.; Hakem, R.; Penninger, J. M.; Mak, T. W. : Apaf1 is required for mitochondrial pathways of apoptosis and brain development.

[24100] Further studies establishing the function and utilities of APAF1 are found in John Hopkins OMIM database record ID 602233, and in cited publications numbered 6292-6296, 230 and 5997-6000 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is another VGAM552 host target gene. HMGA2 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9569, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24101] Another function of VGAM552 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 has been established by previous studies. Ashar et al. (1995) considered the HMGIC gene a good candidate for involvement in lipoma for several reasons, including the facts that it encodes a transcriptional regulating factor, that the pygmy mouse had disproportionately less fat than normal litter mates, and that the mouse gene maps to a region of chromosome 10 with homology of synteny to human

12q14–q15. Therefore, they cloned the human gene and investigated its possible role in lipomas. In FISH studies, Ashar et al. (1995) found apparent deletion of the 3–prime end of the HMGIC gene in translocations associated with lipoma. Chimeric transcripts were isolated from 2 lipomas in which HMGIC DNA–binding domains (AT hook motifs) were fused to either a LIM or an acidic trans–activator domain. The identification of a gene rearranged in a benign neoplastic process suggests a role for HMGIC in adipogenesis and mesenchymal differentiation. Animal model experiments lend further support to the function of HMGA2. To evaluate the role of the HMGIC component in the development of lipoma, Arlotta et al. (2000) expressed the 3 DNA–binding domains of HMGIC in transgenic mice. Despite the ubiquitous expression of the truncated HMGIC protein, the transgenic mice developed a selective abundance of fat tissue early in life, showed marked adipose tissue inflammation, and had an abnormally high incidence of lipomas. These findings demonstrated that the DNA–binding domain of HMGIC, in the absence of a C–terminal fusion partner, are sufficient to perturb adipogenesis and predispose to lipomas.

[24102] It is appreciated that the abovementioned animal model

for HMGA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[24103] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24104] Ashar, H. R.; Schoenberg Fejzo, M.; Tkachenko, A.; Zhou, X.; Fletcher, J. A.; Weremowicz, S.; Morton, C. C.; Chada, K. : Disruption of the architectural factor HMGI-C: DNA-binding AT hook motifs fused in lipomas to distinct transcriptional regulatory domains. Cell 82: 57-65, 1995. ; and

[24105] Arlotta, P.; Tai, A. K.-F.; Manfioletti, G.; Clifford, C.; Jay, G.; Ono, S. J. : Transgenic mice expressing a truncated form of the high mobility group I-C protein develop adiposity and.

[24106] Further studies establishing the function and utilities of HMGA2 are found in John Hopkins OMIM database record ID 600698, and in cited publications numbered 10147-10159, 10242, 10397-10398, 347 and 10399 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A,

Accession NM\_014622) is another VGAM552 host target gene. LOH11CR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOH11CR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOH11CR2A BINDING SITE, designated SEQ ID:15990, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24107] Another function of VGAM552 is therefore inhibition of Loss of Heterozygosity, 11, Chromosomal Region 2, Gene A (LOH11CR2A, Accession NM\_014622). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOH11CR2A. Protein Tyrosine Phosphatase, Receptor Type, J (PTPRJ, Accession NM\_002843) is another VGAM552 host target gene. PTPRJ BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTPRJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRJ BINDING SITE,

designated SEQ ID:8732, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24108] Another function of VGAM552 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, J (PTPRJ, Accession NM\_002843), a gene which Receptor-type protein tyrosine phosphatase J. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRJ. The function of PTPRJ has been established by previous studies. Experimental evidence indicates that specific protein tyrosine phosphatases (PTPases) interact with members of cascades to modulate biologic function differentiation and development. Experiments suggested that the PTPases PTP-beta (OMIM Ref. No. 176882) and PTP-epsilon (OMIM Ref. No. 600926) are involved in the early molecular events for in vitro differentiation of mouse erythroleukemia (MEL) as well as embryonic carcinoma (F9) cells (Watanabe et al., 1995).

[24109] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24110] Watanabe, T.; Mukouyama, Y.; Rhodes, M.; Thomas, M.;

Kume, T.; Oishi, M. : Chromosomal location of murine protein tyrosine phosphatase (Ptp<sup>rj</sup> and Ptp<sup>re</sup>) genes. *Genomics* 29: 793–795, 1995. ; and

[24111] Ruivenkamp, C. A. L.; van Wezel, T.; Zanon, C.; Stassen, A. P. M.; Vlcek, C.; Csikos, T.; Klous, A. M.; Tripodis, N.; Perakakis, A.; Boerrigter, L.; Groot, P. C.; Lindeman, J.; Mooi, W. J.

[24112] Further studies establishing the function and utilities of PTPRJ are found in John Hopkins OMIM database record ID 600925, and in cited publications numbered 10255–1025 and 1583 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM\_021135) is another VGAM552 host target gene. RPS6KA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA2 BINDING SITE, designated SEQ ID:22106, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24113] Another function of VGAM552 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM\_021135), a gene which phosphorylates a wide range of substrates including ribosomal protein s6. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA2. The function of RPS6KA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999) is another VGAM552 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8892, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24114] Another function of VGAM552 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999), a gene which is a cell surface proteoglycan.

Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 has been established by previous studies. The syndecans are trans-membrane heparan sulfate proteoglycans that appear to act as receptors or coreceptors involved in intracellular communication. Syndecan-4 was isolated from rat endothelial cells, as ryudocan, by Kojima et al. (1992) and from human epithelial and fibroblastic cells, under the designation amphiglycan, by David et al. (1992). By analysis of interspecific backcrosses, Spring et al. (1994) mapped the *Synd4* gene to distal mouse chromosome 2, very close to the *Ada* gene. Kojima et al. (1993) mapped the *SYND4* in the human to 20q12-q13 as would be predicted from the mouse location within no more than 2.2 cM of *Ada*. The *BMYC* gene is probably located on human chromosome 20 and has been shown to be located on mouse chromosome 2 (Ingvarsson et al., 1988; Asker et al., 1989). Although *BMYC* is a nonfunctional *MYC*-related gene, its location on chromosome 2 and chromosome 20 in the mouse and the human, respectively, extends the observation of Spring et al. (1994) that 4 members of the *MYC* gene family and 4 members of the syndecan gene

family are closely situated on 4 different chromosomes.

Yu et al. (1995) cloned the human ryudocan promoter.

Analysis of the sequence revealed the presence of several potential sites for nuclear transcription factor binding.

[24115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24116] Spring, J.; Goldberger, O. A.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Bernfield, M. : Mapping of the syndecan genes in the mouse: linkage with members of the Myc gene family. Genomics 21: 597–601, 1994. ; and

[24117] Yu, H.; Humphries, D. E.; Watkins, M.; Karlinsky, J. B. : Molecular cloning of the human ryudocan promoter. Biochem. Biophys. Res. Commun. 212: 1139–1144, 1995.

[24118] Further studies establishing the function and utilities of SDC4 are found in John Hopkins OMIM database record ID 600017, and in cited publications numbered 8784, 11614–878 and 11616 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp762E1312 (Accession NM\_018410) is another VGAM552 host target gene. DKFZp762E1312 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp762E1312,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:20453, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24119] Another function of VGAM552 is therefore inhibition of DKFZp762E1312 (Accession NM\_018410). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312. FLJ14082 (Accession NM\_025024) is another VGAM552 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24613, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24120] Another function of VGAM552 is therefore inhibition of FLJ14082 (Accession NM\_025024). Accordingly, utilities of

VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. FLJ20297 (Accession NM\_017951) is another VGAM552 host target gene. FLJ20297 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE, designated SEQ ID:19652, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24121] Another function of VGAM552 is therefore inhibition of FLJ20297 (Accession NM\_017951). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. FLJ20366 (Accession NM\_017786) is another VGAM552 host target gene. FLJ20366 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20366, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20366 BINDING SITE,

designated SEQ ID:19419, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24122] Another function of VGAM552 is therefore inhibition of FLJ20366 (Accession NM\_017786). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20366. KIAA0014 (Accession NM\_014665) is another VGAM552 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16119, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24123] Another function of VGAM552 is therefore inhibition of KIAA0014 (Accession NM\_014665). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA1274 (Accession XM\_166125) is another VGAM552 host target gene. KIAA1274 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43914, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24124] Another function of VGAM552 is therefore inhibition of KIAA1274 (Accession XM\_166125). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. P450RAI-2 (Accession NM\_019885) is another VGAM552 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21270, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24125] Another function of VGAM552 is therefore inhibition of

P450RAI-2 (Accession NM\_019885). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. SBBI26 (Accession NM\_018846) is another VGAM552 host target gene. SBBI26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBBI26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI26 BINDING SITE, designated SEQ ID:20832, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24126] Another function of VGAM552 is therefore inhibition of SBBI26 (Accession NM\_018846). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI26. Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM\_006643) is another VGAM552 host target gene. SDCCAG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG3 BINDING SITE, designated SEQ ID:13436, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24127] Another function of VGAM552 is therefore inhibition of Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM\_006643). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG3. Syntaxin 1B2 (STX1B2, Accession NM\_052874) is another VGAM552 host target gene. STX1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX1B2 BINDING SITE, designated SEQ ID:27456, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24128] Another function of VGAM552 is therefore inhibition of Syntaxin 1B2 (STX1B2, Accession NM\_052874). Accordingly, utilities of VGAM552 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with STX1B2. LOC120839 (Accession XM\_071729) is another VGAM552 host target gene. LOC120839 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120839 BINDING SITE, designated SEQ ID:37415, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24129] Another function of VGAM552 is therefore inhibition of LOC120839 (Accession XM\_071729). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120839. LOC150245 (Accession XM\_097843) is another VGAM552 host target gene. LOC150245 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150245 BINDING SITE, designated SEQ ID:41163, to

the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24130] Another function of VGAM552 is therefore inhibition of LOC150245 (Accession XM\_097843). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150245. LOC150776 (Accession XM\_032542) is another VGAM552 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150776 BINDING SITE, designated SEQ ID:31678, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24131] Another function of VGAM552 is therefore inhibition of LOC150776 (Accession XM\_032542). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC151610 (Accession XM\_087245) is another VGAM552 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:39137, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24132] Another function of VGAM552 is therefore inhibition of LOC151610 (Accession XM\_087245). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610. LOC199848 (Accession XM\_117144) is another VGAM552 host target gene. LOC199848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199848 BINDING SITE, designated SEQ ID:43251, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24133] Another function of VGAM552 is therefore inhibition of LOC199848 (Accession XM\_117144). Accordingly, utilities

of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199848. LOC220045 (Accession XM\_167820) is another VGAM552 host target gene. LOC220045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220045 BINDING SITE, designated SEQ ID:44862, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24134] Another function of VGAM552 is therefore inhibition of LOC220045 (Accession XM\_167820). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220045. LOC91097 (Accession XM\_035977) is another VGAM552 host target gene. LOC91097 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91097 BINDING SITE, designated SEQ ID:32370, to the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, also designated SEQ ID:3263.

[24135] Another function of VGAM552 is therefore inhibition of LOC91097 (Accession XM\_035977). Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 553 (VGAM553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24136] VGAM553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM553 was detected is described hereinabove with reference to Figs. 1–8.

[24137] VGAM553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Parainfluenza Virus 3. VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24138] VGAM553 gene encodes a VGAM553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM553 precursor RNA is designated SEQ ID:539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:539 is located at position 7376 relative to the genome of Bovine Parainfluenza Virus 3.

[24139] VGAM553 precursor RNA folds onto itself, forming VGAM553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24140] An enzyme complex designated DICER COMPLEX, `dices` the VGAM553 folded precursor RNA into VGAM553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM553 RNA is designated SEQ ID:3264, and is provided hereinbelow with reference to the sequence listing part.

[24141] VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM553 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24142] VGAM553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM553 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24143] The complementary binding of VGAM553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM553 host target RNA into VGAM553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24144] It is appreciated that VGAM553 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM553 host target genes. The mRNA of each one of this plurality of VGAM553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM553 RNA, herein designated VGAM RNA, and which when bound by VGAM553 RNA causes inhibition of translation of respective one or more VGAM553 host target proteins.

[24145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM553 gene, herein designated VGAM GENE, on one or more VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[24146] It is yet further appreciated that a function of VGAM553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment of viral infection by Bovine Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM553 correlate with, and may be deduced from, the identity of the host target genes which VGAM553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24147] Nucleotide sequences of the VGAM553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM553 are further described hereinbelow with reference to Table 1.

[24148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM553 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24149] As mentioned hereinabove with reference to Fig. 1, a function of VGAM553 gene, herein designated VGAM is inhibition of expression of VGAM553 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM553 correlate with, and may be deduced from, the identity of the target genes which VGAM553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24150] NDRG Family Member 3 (NDRG3, Accession NM\_022477) is a VGAM553 host target gene. NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2, designated SEQ ID:22848 and SEQ ID:25724 respectively, to the nucleotide sequence of VGAM553 RNA, herein designated VGAM RNA, also designated SEQ

ID:3264.

[24151] A function of VGAM553 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM\_022477). Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. LOC115073 (Accession XM\_055193) is another VGAM553 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36234, to the nucleotide sequence of VGAM553 RNA, herein designated VGAM RNA, also designated SEQ ID:3264.

[24152] Another function of VGAM553 is therefore inhibition of LOC115073 (Accession XM\_055193). Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC147072 (Accession XM\_017121) is another VGAM553 host target gene. LOC147072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147072, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147072 BINDING SITE, designated SEQ ID:30299, to the nucleotide sequence of VGAM553 RNA, herein designated VGAM RNA, also designated SEQ ID:3264.

[24153] Another function of VGAM553 is therefore inhibition of LOC147072 (Accession XM\_017121). Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147072. LOC148085 (Accession XM\_097388) is another VGAM553 host target gene. LOC148085 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148085 BINDING SITE, designated SEQ ID:40867, to the nucleotide sequence of VGAM553 RNA, herein designated VGAM RNA, also designated SEQ ID:3264.

[24154] Another function of VGAM553 is therefore inhibition of LOC148085 (Accession XM\_097388). Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148085. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 554 (VGAM554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24155] VGAM554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM554 was detected is described hereinabove with reference to Figs. 1–8.

[24156] VGAM554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Exigua Nucleopolyhedrovirus. VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24157] VGAM554 gene encodes a VGAM554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM554 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM554 precursor RNA is designated SEQ

ID:540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:540 is located at position 47344 relative to the genome of Spodoptera Exigua Nucleopolyhedrovirus.

[24158] VGAM554 precursor RNA folds onto itself, forming VGAM554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24159] An enzyme complex designated DICER COMPLEX, `dices` the VGAM554 folded precursor RNA into VGAM554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM554 RNA is designated SEQ ID:3265, and is provided hereinbelow with reference to the sequence

listing part.

[24160] VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM554 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24161] VGAM554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM554 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM554 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24162] The complementary binding of VGAM554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM554 host target RNA into VGAM554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24163] It is appreciated that VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM554 host target genes. The mRNA of each one of this plurality of VGAM554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM554 RNA, herein designated VGAM

RNA, and which when bound by VGAM554 RNA causes inhibition of translation of respective one or more VGAM554 host target proteins.

[24164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM554 gene, herein designated VGAM GENE, on one or more VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24165] It is yet further appreciated that a function of VGAM554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM554 include diagnosis, prevention and treatment of viral infection by Spodoptera Exigua Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM554 correlate with, and may be deduced from, the identity of the host target genes which VGAM554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24166] Nucleotide sequences of the VGAM554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM554 are further described hereinbelow with reference to Table 1.

[24167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM554 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24168] As mentioned hereinabove with reference to Fig. 1, a function of VGAM554 gene, herein designated VGAM is

inhibition of expression of VGAM554 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM554 correlate with, and may be deduced from, the identity of the target genes which VGAM554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24169] EphA8 (EPA8, Accession NM\_020526) is a VGAM554 host target gene. EPA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPA8 BINDING SITE, designated SEQ ID:21743, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24170] A function of VGAM554 is therefore inhibition of EphA8 (EPA8, Accession NM\_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPA8. The function of EPA8 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM494. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586) is another VGAM554 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15945, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24171] Another function of VGAM554 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Integrin, Alpha 11 (ITGA11, Accession NM\_012211) is another VGAM554 host target gene. ITGA11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of ITGA11 BINDING SITE, designated SEQ ID:14512, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24172] Another function of VGAM554 is therefore inhibition of Integrin, Alpha 11 (ITGA11, Accession NM\_012211), a gene which acts as a collagen I receptor. Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA11. The function of ITGA11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Nucleolar Protein 3 (apoptosis repressor with CARD domain) (NOL3, Accession NM\_003946) is another VGAM554 host target gene. NOL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOL3 BINDING SITE, designated SEQ ID:10064, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24173] Another function of VGAM554 is therefore inhibition of Nucleolar Protein 3 (apoptosis repressor with CARD domain) (NOL3, Accession NM\_003946), a gene which inhibits CASP2 and CASP8 and interacts with splicing factors. Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOL3. The function of NOL3 has been established by previous studies. By searching an EST database for apoptosis-regulating proteins with homology to the caspase recruitment domain (CARD) of caspase-9 (CASP9; 602234), Koseki et al. (1998) identified a cDNA encoding ARC (apoptosis repressor with CARD). Sequence analysis predicted that the 208-amino acid ARC protein contains an N-terminal CARD and a C-terminal region rich in proline and glutamic acid. Northern blot analysis detected 5.5- and 1.0-kb ARC transcripts in skeletal muscle and heart, but no expression was detected in brain, placenta, lung, liver, kidney, pancreas, and lymphoid/hematopoietic tissues. To identify proteins involved in RNA processing, Stoss et al. (1999) used a yeast 2-hybrid screen with SRp30c (SFRS9; 601943) as bait on a HeLa library. They isolated a cDNA encoding a protein that they designated NOP30 (nucleolar protein of 30 kD) based on

SDS–PAGE analysis. The authors also identified a cDNA encoding a smaller isoform that they termed MYC (muscle–enriched cytosolic protein), which is created by a frameshift and is identical to the ARC protein reported by Koseki et al. (1998). MYC did not interact with SFRS9. Sequence analysis of the 219–amino acid NOP30 protein predicted that it contains a highly acidic N terminus and a basic C terminus enriched with arginines, serines, and prolines and having multiple phosphorylation sites. Northern blot analysis detected 1.8– and 1.3–kb NOP30 transcripts, with highest expression in heart and skeletal muscle and weak expression in other tissues. In contrast, SFRS9 is relatively strongly and ubiquitously expressed as a 1.35–kb transcript. In situ hybridization analysis showed that NOP30 is expressed in the pia mater, a tissue surrounding the brain containing blood vessels lined with smooth muscle cells. Binding analysis indicated that NOP30 binds to itself and that the N and C termini of NOP30 interact with SFRS9 through its RS domain. Confocal microscopy demonstrated that NOP30, through its arginine–rich C terminus, colocalizes with B23 (NPM1; 164040) in the granular component of nucleoli; however, the majority of NOP30 was localized in the fibrillar com–

ponent. NOP30 and SFRS9 colocalized in the nucleoplasm. In contrast, MYP, with its acidic N terminus, was predominantly localized in the cytoplasm.

[24174] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24175] Koseki, T.; Inohara, N.; Chen, S.; Nunez, G. : ARC, an inhibitor of apoptosis expressed in skeletal muscle and heart that interacts selectively with caspases. Proc. Nat. Acad. Sci. 95: 5156–5160, 1998. ; and

[24176] Stoss, O.; Schwaiger, F.–W.; Cooper, T. A.; Stamm, S. : Alternative splicing determines the intracellular localization of the novel nuclear protein Nop30 and its interaction with the sp.

[24177] Further studies establishing the function and utilities of NOL3 are found in John Hopkins OMIM database record ID 605235, and in cited publications numbered 7309–731 and 940 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RecQ Protein-like 5 (RECQL5, Accession NM\_004259) is another VGAM554 host target gene. RECQL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RECQL5, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:10447, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24178] Another function of VGAM554 is therefore inhibition of RecQ Protein-like 5 (RECQL5, Accession NM\_004259). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 2 (SMARCD2, Accession NM\_003077) is another VGAM554 host target gene. SMARCD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD2 BINDING SITE, designated SEQ ID:9050, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24179] Another function of VGAM554 is therefore inhibition of

SWI/SNF Related, Matrix Associated, Actin Dependent  
Regulator of Chromatin, Subfamily D, Member 2

(SMARCD2, Accession NM\_003077), a gene which is involved in chromatin remodeling. Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD2. The function of SMARCD2 has been established by previous studies. Chromatin is actively remodeled during development. Chromatin remodeling of certain genes appears to precede their transcriptional activation. In yeast, the multisubunit SWI/SNF complex is thought to be responsible for chromatin remodeling. Wang et al. (1996) isolated an analogous SWI/SNF complex from the human YT cell line. They found that the resultant complexes are composed of 9 to 12 polypeptides, which they termed BAFs (for BRG1-associated factors). Wang et al. (1996) cloned the BAF60b subunit based on its homology with BAF60a (OMIM Ref. No. 601735). BAF60b encodes a polypeptide of 475 amino acids and is homologous to the yeast SWP73 gene, a component of the yeast SWI/SNF chromatin remodeling complex. The human genes BAF60a, BAF60b, and BAF60c (OMIM Ref. No. 601737) are highly homologous. By PCR of a somatic cell hybrid panel

and radiation hybrid analysis, Ring et al. (1998) mapped the SMARCD2 gene to chromosome 17q23–q24

[24180] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24181] Ring, H. Z.; Vameghi–Meyers, V.; Wang, W.; Crabtree, G. R.; Francke, U. : Five SWI/SNF–related, matrix–associated, actin–dependent regulator of chromatin (SMARC) genes are dispersed in the human genome. Genomics 51: 140–143, 1998. ; and

[24182] Wang, W.; Xue, Y.; Zhou, S.; Kuo, A.; Cairns, B. R.; Crabtree, G. R. : Diversity and specialization of mammalian SWI/SNF complexes. Genes Dev. 10: 2117–2130, 1996.

[24183] Further studies establishing the function and utilities of SMARCD2 are found in John Hopkins OMIM database record ID 601736, and in cited publications numbered 9322–9323 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM\_138691) is another VGAM554 host target gene. TMC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TMC1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMC1 BINDING SITE, designated SEQ ID:28933, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24184] Another function of VGAM554 is therefore inhibition of Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM\_138691), a gene which is required for normal function of cochlear hair cells. Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMC1. The function of TMC1 has been established by previous studies. By positional cloning, Kurima et al. (2002) identified the gene mutant in a form of autosomal dominant deafness (DFNA36; 606705) and of recessive deafness (DFNB7/B11; 600974) that map to the same interval on 9q13–q21. The authors evaluated several candidate genes in the critical region but found no mutations in the deaf families. To identify additional DFNA36/B7/B11 candidate genes based upon sequence similarity to related genes elsewhere in the genome, they initiated a systematic BLAST analysis of segments of genomic DNA sequence in the critical region. One sequence was found to be similar to a

predicted gene (subsequently named TMC2; 606707) on 20p13. They used conserved sequences between TMC2 and the query sequence (subsequently named TMC1) on chromosome 9q13–q21 to design primers for amplifying potential TMC1 transcripts from a human fetal brain cDNA library. Kurima et al. (2002) found the longest open reading frame to be 2,283 nucleotides, predicting an 87–kD protein. The TMC1 protein is predicted to contain 6 transmembrane domains and to have cytoplasmic orientation of N and C termini. Kurima et al. (2002) obtained the orthologous mouse *Tmc1* cDNA by RT–PCR and 5–prime and 3–prime RACE of mouse inner–ear cDNA. They found that in the mouse, *Tmc1* mRNA is expressed in hair cells of the postnatal cochlea and vestibular end organs and is required for normal function of cochlear hair cells. Animal model experiments lend further support to the function of TMC1. Vreugde et al. (2002) identified a missense mutation in the *Tmc1* gene in the mouse deaf mutant 'Beethoven' (Bth). Thus it is a mouse model for autosomal dominant progressive hearing loss (DFNA36; 606705). Similarly, the recessive deafness mutation *dn*, which maps to mouse chromosome 19, is a model of profound congenital deafness caused by mutations in the TMC1 gene:

DFNB7 (OMIM Ref. No. 600974), also known as DFNB11.

[24185] It is appreciated that the abovementioned animal model for TMC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[24186] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24187] Kurima, K.; Peters. L. M.; Yang, Y.; Riazuddin, S.; Ahmed, Z. M.; Naz, S.; Arnaud, D.; Drury, S.; Mo, J.; Makishima, T.; Ghosh, M.; Menon, P. S. N.; and 13 others : Dominant and recessive deafness caused by mutations of a novel gene, TMC1, required for cochlear hair-cell function. *Nature Genet.* 30: 277–284, 2002. ; and

[24188] Vreugde, S.; Erven, A.; Kros, C. J.; Marcotti, W.; Fuches, H.; Kurima, K.; Wilcox, E. R.; Friedman, T. B.; Griffith, A. J.; Balling, R.; de Angelis, M. H.; Avraham, K. B.; Steel, K. P.

[24189] Further studies establishing the function and utilities of TMC1 are found in John Hopkins OMIM database record ID 606706, and in cited publications numbered 7799 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bobby Sox Homolog (*Drosophila*) (BBX, Accession NM\_020235) is another

VGAM554 host target gene. BBX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BBX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BBX BINDING SITE, designated SEQ ID:21504, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24190] Another function of VGAM554 is therefore inhibition of Bobby Sox Homolog (Drosophila) (BBX, Accession NM\_020235). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BBX. EphA7 (EPHA7, Accession NM\_004440) is another VGAM554 host target gene. EPHA7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EPHA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA7 BINDING SITE, designated SEQ ID:10724, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ

ID:3265.

[24191] Another function of VGAM554 is therefore inhibition of EphA7 (EPHA7, Accession NM\_004440). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA7. FLJ14213 (Accession NM\_024841) is another VGAM554 host target gene. FLJ14213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14213 BINDING SITE, designated SEQ ID:24251, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24192] Another function of VGAM554 is therefore inhibition of FLJ14213 (Accession NM\_024841). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14213. FLJ20004 (Accession XM\_170889) is another VGAM554 host target gene. FLJ20004 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20004, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:45646, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24193] Another function of VGAM554 is therefore inhibition of FLJ20004 (Accession XM\_170889). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004. FLJ20378 (Accession NM\_017795) is another VGAM554 host target gene. FLJ20378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20378 BINDING SITE, designated SEQ ID:19434, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24194] Another function of VGAM554 is therefore inhibition of FLJ20378 (Accession NM\_017795). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20378. KIAA0711 (Accession NM\_014867) is another VGAM554 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16961, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24195] Another function of VGAM554 is therefore inhibition of KIAA0711 (Accession NM\_014867). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA0992 (Accession NM\_016081) is another VGAM554 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:18158, to the

nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24196] Another function of VGAM554 is therefore inhibition of KIAA0992 (Accession NM\_016081). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1130 (Accession XM\_031104) is another VGAM554 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31280, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24197] Another function of VGAM554 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM\_045261) is another VGAM554 host target gene. LRRN3 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LRRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRN3 BINDING SITE, designated SEQ ID:34401, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24198] Another function of VGAM554 is therefore inhibition of Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM\_045261). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN3. MGC22014 (Accession XM\_035307) is another VGAM554 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32216, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24199] Another function of VGAM554 is therefore inhibition of MGC22014 (Accession XM\_035307). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. MGC3248 (Accession NM\_032486) is another VGAM554 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26236, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24200] Another function of VGAM554 is therefore inhibition of MGC3248 (Accession NM\_032486). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM554 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39388, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24201] Another function of VGAM554 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PRO2859 (Accession NM\_018543) is another VGAM554 host target gene. PRO2859 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2859 BINDING SITE, designated SEQ ID:20615, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24202] Another function of VGAM554 is therefore inhibition of PRO2859 (Accession NM\_018543). Accordingly, utilities of

VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2859. Protein Serine Kinase H1 (PSKH1, Accession XM\_043047) is another VGAM554 host target gene. PSKH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSKH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:33867, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24203] Another function of VGAM554 is therefore inhibition of Protein Serine Kinase H1 (PSKH1, Accession XM\_043047). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1. LOC123242 (Accession XM\_063548) is another VGAM554 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37239, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24204] Another function of VGAM554 is therefore inhibition of LOC123242 (Accession XM\_063548). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC127703 (Accession XM\_059172) is another VGAM554 host target gene. LOC127703 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127703 BINDING SITE, designated SEQ ID:36908, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24205] Another function of VGAM554 is therefore inhibition of LOC127703 (Accession XM\_059172). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127703. LOC157273 (Accession XM\_098743) is an-

other VGAM554 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41781, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24206] Another function of VGAM554 is therefore inhibition of LOC157273 (Accession XM\_098743). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC221463 (Accession XM\_166374) is another VGAM554 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44204, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24207] Another function of VGAM554 is therefore inhibition of LOC221463 (Accession XM\_166374). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC253001 (Accession XM\_171711) is another VGAM554 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46056, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24208] Another function of VGAM554 is therefore inhibition of LOC253001 (Accession XM\_171711). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC56965 (Accession NM\_020213) is another VGAM554 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21453, to the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, also designated SEQ ID:3265.

[24209] Another function of VGAM554 is therefore inhibition of LOC56965 (Accession NM\_020213). Accordingly, utilities of VGAM554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 555 (VGAM555) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24210] VGAM555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM555 was detected is described hereinabove with reference to Figs. 1–8.

[24211] VGAM555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Exigua Nucleopolyhedrovirus. VGAM555 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24212] VGAM555 gene encodes a VGAM555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM555 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM555 precursor RNA is designated SEQ ID:541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:541 is located at position 47117 relative to the genome of Spodoptera Exigua Nucleopolyhedrovirus.

[24213] VGAM555 precursor RNA folds onto itself, forming VGAM555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24214] An enzyme complex designated DICER COMPLEX, `dices` the VGAM555 folded precursor RNA into VGAM555 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM555 RNA is designated SEQ ID:3266, and is provided hereinbelow with reference to the sequence listing part.

[24215] VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM555 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24216] VGAM555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM555 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24217] The complementary binding of VGAM555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM555 host target RNA into VGAM555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[24218] It is appreciated that VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM555 host target genes. The mRNA of each one of this plurality of VGAM555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM555 RNA, herein designated VGAM RNA, and which when bound by VGAM555 RNA causes inhibition of translation of respective one or more VGAM555 host target proteins.

[24219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM555 gene, herein designated VGAM GENE, on one or more VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24220] It is yet further appreciated that a function of VGAM555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM555 include diagnosis, prevention and treatment of viral infection by Spodoptera Exigua Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM555 correlate with, and may be deduced from, the identity of the host target genes which VGAM555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24221] Nucleotide sequences of the VGAM555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM555 are further described hereinbelow with reference to Table 1.

[24222] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM555 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24223] As mentioned hereinabove with reference to Fig. 1, a function of VGAM555 gene, herein designated VGAM is inhibition of expression of VGAM555 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM555 correlate with, and may be deduced from, the identity of the target genes which VGAM555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24224] Protein Tyrosine Kinase 2 Beta (PTK2B, Accession NM\_004103) is a VGAM555 host target gene. PTK2B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTK2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK2B BINDING SITE, designated SEQ ID:10312, to the nucleotide sequence of VGAM555 RNA, herein designated

VGAM RNA, also designated SEQ ID:3266.

[24225] A function of VGAM555 is therefore inhibition of Protein Tyrosine Kinase 2 Beta (PTK2B, Accession NM\_004103), a gene which is involved in calcium induced regulation of ion channel and activation of the map kinase signaling pathway. Accordingly, utilities of VGAM555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK2B. The function of PTK2B has been established by previous studies. Lev et al. (1995) showed that the PYK2 protein undergoes rapid tyrosine phosphorylation in response to various stimuli that elevate intracellular calcium concentration, such as addition of bradykinin, a neuropeptide hormone that binds to a G protein-coupled receptor and in turn stimulates phosphatidylinositol hydrolysis. PYK2 is also tyrosine phosphorylated following activation of the nicotinic acetylcholine receptor (see OMIM Ref. No. 100690), by membrane depolarization, and by treatment of cells with a calcium ionophore. Protein kinase C (OMIM Ref. No. 176960) activation also induces PYK2 phosphorylation. Activation of PYK2 leads to the modulation of ion channel function and activation of the MAP kinase signaling pathway. Lev et al. (1995) proposed that PYK2 may represent an important

signaling intermediate between neuropeptide activated receptors or neurotransmitters that increase calcium flux and the downstream signals that regulate neuronal activity. PYK2 may also provide a mechanism for a variety of short- and long-term calcium-dependent signaling events in the nervous system. Hepatitis B virus (HBV) causes acute and chronic infection of the liver and is also a risk factor for hepatic cancer. The virus has only 4 open reading frames, 3 of which encode the capsid, envelope, and polymerase proteins. The fourth encodes HBX, a poorly expressed protein required for viral replication (Ganem, 2001). Bouchard et al. (2001) showed that HBX induces release of calcium into the cytoplasm, presumably from mitochondria or endoplasmic reticulum. HBX expression thereby induces activation of PYK2, which activates SRC (OMIM Ref. No. 190090) and HBV DNA replication. Inhibition of PYK2 or calcium signaling mediated by mitochondrial calcium channels could block HBV DNA replication, and enhancement of cytoplasmic calcium was able to substitute for HBX in stimulating HBV DNA replication.

[24226] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24227] Lev, S.; Moreno, H.; Martinez, R.; Canoll, P.; Peles, E.; Musacchio, J. M.; Plowman, G. D.; Rudy, B.; Schlessinger, J. : Protein tyrosine kinase PYK2 involved in  $\text{Ca}^{2+}$ -induced regulation of ion channel and MAP kinase functions. *Nature* 376: 737–745, 1995. ; and

[24228] Bouchard, M. J.; Wang, L.-H.; Schneider, R. J. : Calcium signaling by HBx protein in hepatitis B virus DNA replication. *Science* 294: 2376–2378, 2001.

[24229] Further studies establishing the function and utilities of PTK2B are found in John Hopkins OMIM database record ID 601212, and in cited publications numbered 6887–6893 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10583 (Accession NM\_018148) is another VGAM555 host target gene. FLJ10583 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10583 BINDING SITE, designated SEQ ID:19949, to the nucleotide sequence of VGAM555 RNA, herein designated VGAM RNA, also designated SEQ ID:3266.

[24230] Another function of VGAM555 is therefore inhibition of FLJ10583 (Accession NM\_018148). Accordingly, utilities of VGAM555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10583. MGC4562 (Accession NM\_133375) is another VGAM555 host target gene. MGC4562 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4562 BINDING SITE, designated SEQ ID:28496, to the nucleotide sequence of VGAM555 RNA, herein designated VGAM RNA, also designated SEQ ID:3266.

[24231] Another function of VGAM555 is therefore inhibition of MGC4562 (Accession NM\_133375). Accordingly, utilities of VGAM555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4562. Trimethyllysine Hydroxylase, Epsilon (TMLHE, Accession NM\_018196) is another VGAM555 host target gene. TMLHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMLHE, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMLHE BINDING SITE, designated SEQ ID:20062, to the nucleotide sequence of VGAM555 RNA, herein designated VGAM RNA, also designated SEQ ID:3266.

[24232] Another function of VGAM555 is therefore inhibition of Trimethyllysine Hydroxylase, Epsilon (TMLHE, Accession NM\_018196). Accordingly, utilities of VGAM555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMLHE. LOC139673 (Accession XM\_071645) is another VGAM555 host target gene. LOC139673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139673 BINDING SITE, designated SEQ ID:37403, to the nucleotide sequence of VGAM555 RNA, herein designated VGAM RNA, also designated SEQ ID:3266.

[24233] Another function of VGAM555 is therefore inhibition of LOC139673 (Accession XM\_071645). Accordingly, utilities

of VGAM555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139673. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 556 (VGAM556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24234] VGAM556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM556 was detected is described hereinabove with reference to Figs. 1–8.

[24235] VGAM556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Exigua Nucleopolyhedrovirus. VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24236] VGAM556 gene encodes a VGAM556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM556 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM556 precursor RNA is designated SEQ ID:542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:542 is located at position 47004 relative to the genome of Spodoptera Exigua Nucleopolyhedrovirus.

[24237] VGAM556 precursor RNA folds onto itself, forming VGAM556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM556 folded precursor RNA into VGAM556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM556 RNA is designated SEQ ID:3267, and

is provided hereinbelow with reference to the sequence listing part.

[24239] VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM556 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24240] VGAM556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM556 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24241] The complementary binding of VGAM556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM556 host target RNA into VGAM556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24242] It is appreciated that VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM556 host target genes. The mRNA of each one of this plurality of VGAM556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM556 RNA, herein designated VGAM RNA, and which when bound by VGAM556 RNA causes inhibition of translation of respective one or more VGAM556 host target proteins.

[24243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM556 gene, herein designated VGAM GENE, on one or more VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24244] It is yet further appreciated that a function of VGAM556 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of viral infection by Spodoptera Exigua Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM556 correlate with, and may be deduced from, the identity of the host target genes which VGAM556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24245] Nucleotide sequences of the VGAM556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM556 are further described hereinbelow with reference to Table 1.

[24246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM556 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24247] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM556 gene, herein designated VGAM is inhibition of expression of VGAM556 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM556 correlate with, and may be deduced from, the identity of the target genes which VGAM556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24248] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 2 (arg, Abelson-related gene) (ABL2, Accession NM\_007314) is a VGAM556 host target gene. ABL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL2 BINDING SITE, designated SEQ ID:14229, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24249] A function of VGAM556 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 2 (arg, Abelson-related gene) (ABL2, Accession NM\_007314), a gene which Cytoplasmic tyrosine kinase of the Abelson subfamily. Accordingly, utilities of VGAM556 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with ABL2. The function of ABL2 has been established by previous studies. Kruh et al. (1986) identified a novel oncogene related to ABL (OMIM Ref. No. 189980) in DNA sequences from human plasma. The new sequence, called ARG by the authors, was localized by in situ hybridization and somatic cell analysis to human chromosome 1q24–q25. The detection of a novel 12–kb transcript from this gene in human normal and tumor cells establishes it as a new member of the tyrosine kinase family that is closely related to but distinct from ABL. A constitutional fragile site is located at 1q24–q25. Seldin and Kruh (1989) mapped the mouse homolog (Abll) to chromosome 1 by analysis of segregation with other distal chromosome 1 genetic polymorphisms in a panel of DNAs from interspecific backcross mice. This defined a region of distal mouse chromosome 1 homologous with human chromosome 1q21–q32.

[24250] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24251] Kruh, G. D.; King, C. R.; Kraus, M. H.; Popescu, N. C.; Amsbaugh, S. C.; McBride, W. O.; Aaronson, S. A. : A novel

human gene closely related to the abl proto-oncogene.

Science 234: 1545–1548, 1986. ; and

[24252] Seldin, M. F.; Kruh, G. D. : Mapping of Abl within a conserved linkage group on distal mouse chromosome 1 syntenic with human chromosome 1 using an interspecific cross. Genomics 4: 221–.

[24253] Further studies establishing the function and utilities of ABL2 are found in John Hopkins OMIM database record ID 164690, and in cited publications numbered 10900–10901, 1103 and 11040 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP Synthase, H<sup>+</sup> Transporting, Mitochondrial F<sub>0</sub> Complex, Subunit F6 (ATP5J, Accession NM\_001685) is another VGAM556 host target gene. ATP5J BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP5J, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5J BINDING SITE, designated SEQ ID:7406, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24254] Another function of VGAM556 is therefore inhibition of

ATP Synthase, H<sup>+</sup> Transporting, Mitochondrial F0 Complex, Subunit F6 (ATP5J, Accession NM\_001685), a gene which is one of the chains of the nonenzymatic component of the mitochondrial ATPase complex. Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5J. The function of ATP5J has been established by previous studies. H<sup>(+)</sup>-ATP synthase is a multisubunit membrane-bound enzyme complex consisting of an F0 segment embedded in the membrane and an F1 segment attached to the F0. The F1 segment provides the catalytic activity for the interconversion of ADP and ATP, whereas the F0 segment contains a proton channel that couples the transmembrane H<sup>+</sup> gradient and membrane potential generated by electron transport to the synthesis of ATP in the F1 domain. Coupling factor 6 (F6) is a soluble integral component of mitochondrial ATP synthase that is required for the interactions of the catalytic and proton-translocating segments. Higuti et al. (1991) and Javed et al. (1991) independently isolated a cDNA encoding F6, or ATP5J, from human kidney and human fetal muscle cDNA libraries, respectively. The deduced protein consists of a 32-amino acid import signal peptide and a mature

76-amino acid polypeptide with an estimated molecular mass of 8,969 Da. Javed et al. (1991) and Higuti et al. (1991) noted that the predicted import signal peptide is rich in basic amino acids, devoid of acidic amino acids, and amphiphilic, which allows it to be water-soluble yet capable of passage through the phospholipid membrane bilayers. The authors reported that the mature human F6 protein has 81% sequence identity with bovine F6, and Higuti et al. (1991) stated that human F6 shares 72% sequence identity with rat F6.

[24255] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24256] Higuti, T.; Tsurumi, C.; Kawamura, Y.; Tsujita, H.; Osaka, F.; Yoshihara, Y.; Tani, I.; Tanaka, K.; Ichihara, A. : Molecular cloning of cDNA for the import precursor of human coupling factor 6 of H(+)-ATP synthase in mitochondria. Biochem. Biophys. Res. Commun. 178: 793-799, 1991. ; and

[24257] Javed, A. A.; Ogata, K.; Sanadi, D. R. : Human mitochondrial ATP synthase: cloning cDNA for the nuclear-encoded precursor of coupling factor 6. Gene 97: 307-310, 1991.

[24258] Further studies establishing the function and utilities of

ATP5J are found in John Hopkins OMIM database record ID 603152, and in cited publications numbered 5432–5434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932) is another VGAM556 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11374, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24259] Another function of VGAM556 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM60.Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004022) is another VGAM556 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10233, SEQ ID:10194 and SEQ ID:10221 respectively, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24260] Another function of VGAM556 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004022), a gene which muscular dystrophy . Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.Neuregulin 2 (NRG2, Accession NM\_004883) is

another VGAM556 host target gene. NRG2 BINDING SITE1 through NRG2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRG2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRG2 BINDING SITE1 through NRG2 BINDING SITE6, designated SEQ ID:11318, SEQ ID:15144, SEQ ID:15143, SEQ ID:15145, SEQ ID:15146 and SEQ ID:15147 respectively, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24261] Another function of VGAM556 is therefore inhibition of Neuregulin 2 (NRG2, Accession NM\_004883), a gene which recruits erbb1 and erbb2 coreceptors resulting in ligand-stimulated tyrosine phosphorylation and activation of the erbb receptors. Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRG2. The function of NRG2 has been established by previous studies. Neuregulins are a family of growth and differentiation factors that are related to epidermal growth factor (EGF; 131530). The receptors for neuregulins are the ERBB fam-

ily of tyrosine kinase transmembrane receptors, which includes the EGF receptor (EGFR; 131550), ERBB2 (OMIM Ref. No. 164870), ERBB3 (OMIM Ref. No. 190151), and ERBB4 (OMIM Ref. No. 600543). Through interaction with ERBB receptors, neuregulins induce the growth and differentiation of epithelial, neuronal, glial, and other types of cells (Burden and Yarden, 1997). In particular, the neuregulin-ERBB signaling pathways play crucial roles in regulating the proliferation and differentiation of Schwann cells, the myelin-forming cells in the peripheral nervous system. For additional information about neuregulins, see NRG1 (OMIM Ref. No. 142445). Using homologous mouse cDNA as probe, Busfield et al. (1997) cloned 2 NRG2 variants, which they called DON-1r and DON-1b, from a human fetal brain library. The clones predict mosaic proteins containing an N-terminal domain, an immunoglobulin-C2 loop, an EGF-like domain, a transmembrane sequence, and a large cytoplasmic tail showing a number of potential N-linked and O-linked glycosylation sites. DON-1b differs from DON-1r by an 8-amino acid insertion proximal to the transmembrane domain. Northern blot analysis of adult human tissues revealed expression of 3- and 4-kb transcripts restricted to the cerebellum. Expression was

also detected in fetal brain and lung. In situ hybridization of mouse brain sections revealed restricted expression in the cerebellum and dentate gyrus.

[24262] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24263] Burden, S.; Yarden, Y. : Neuregulins and their receptors: a versatile signaling module in organogenesis and oncogenesis. *Neuron* 18: 847–855, 1997. ; and

[24264] Busfield, S. J.; Michnick, D. A.; Chickering, T. W.; Revett, T. L.; Ma, J.; Woolf, E. A.; Comrack, C. A.; Dussault, B. J.; Woolf, J.; Goodearl, A. D. J.; Gearing, D. P. : Characterizati.

[24265] Further studies establishing the function and utilities of NRG2 are found in John Hopkins OMIM database record ID 603818, and in cited publications numbered 4913–4918 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10748

(Accession NM\_018203) is another VGAM556 host target gene. FLJ10748 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu–

cleotide sequences of FLJ10748 BINDING SITE, designated SEQ ID:20086, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24266] Another function of VGAM556 is therefore inhibition of FLJ10748 (Accession NM\_018203). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10748. FLJ10925 (Accession NM\_018275) is another VGAM556 host target gene. FLJ10925 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10925 BINDING SITE, designated SEQ ID:20259, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24267] Another function of VGAM556 is therefore inhibition of FLJ10925 (Accession NM\_018275). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10925. FLJ20315 (Accession NM\_017763) is another VGAM556

host target gene. FLJ20315 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20315 BINDING SITE, designated SEQ ID:19379, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24268] Another function of VGAM556 is therefore inhibition of FLJ20315 (Accession NM\_017763). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20315. Leucine-rich Repeat LGI Family, Member 3 (LGI3, Accession NM\_139278) is another VGAM556 host target gene. LGI3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI3 BINDING SITE, designated SEQ ID:29279, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24269] Another function of VGAM556 is therefore inhibition of Leucine-rich Repeat LIG Family, Member 3 (LIG3, Accession NM\_139278). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG3. MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM\_003684) is another VGAM556 host target gene. MKNK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MKNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKNK1 BINDING SITE, designated SEQ ID:9792, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24270] Another function of VGAM556 is therefore inhibition of MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM\_003684). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKNK1. PM5 (Accession XM\_027359) is another VGAM556 host target gene. PM5 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by PM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PM5 BINDING SITE, designated SEQ ID:30497, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24271] Another function of VGAM556 is therefore inhibition of PM5 (Accession XM\_027359). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PM5. Protein Tyrosine Phosphatase, Non-receptor Type 4 (megakaryocyte) (PTPN4, Accession NM\_002830) is another VGAM556 host target gene. PTPN4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTPN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN4 BINDING SITE, designated SEQ ID:8707, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24272] Another function of VGAM556 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 4 (megakaryocyte) (PTPN4, Accession NM\_002830). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN4. LOC145748 (Accession XM\_096853) is another VGAM556 host target gene. LOC145748 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145748 BINDING SITE, designated SEQ ID:40579, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24273] Another function of VGAM556 is therefore inhibition of LOC145748 (Accession XM\_096853). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145748. LOC151445 (Accession XM\_045283) is another VGAM556 host target gene. LOC151445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151445, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151445 BINDING SITE, designated SEQ ID:34419, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24274] Another function of VGAM556 is therefore inhibition of LOC151445 (Accession XM\_045283). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151445. LOC163682 (Accession XM\_099402) is another VGAM556 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42096, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24275] Another function of VGAM556 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC163682. LOC197003 (Accession XM\_113798) is another VGAM556 host target gene. LOC197003 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197003 BINDING SITE, designated SEQ ID:42444, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24276] Another function of VGAM556 is therefore inhibition of LOC197003 (Accession XM\_113798). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197003. LOC221975 (Accession XM\_166534) is another VGAM556 host target gene. LOC221975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221975 BINDING SITE, designated SEQ ID:44495, to

the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24277] Another function of VGAM556 is therefore inhibition of LOC221975 (Accession XM\_166534). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221975. LOC254712 (Accession XM\_171104) is another VGAM556 host target gene. LOC254712 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254712 BINDING SITE, designated SEQ ID:45912, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24278] Another function of VGAM556 is therefore inhibition of LOC254712 (Accession XM\_171104). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254712. LOC93538 (Accession XM\_051927) is another VGAM556 host target gene. LOC93538 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC93538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93538 BINDING SITE, designated SEQ ID:35923, to the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, also designated SEQ ID:3267.

[24279] Another function of VGAM556 is therefore inhibition of LOC93538 (Accession XM\_051927). Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 557 (VGAM557) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24280] VGAM557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM557 was detected is described hereinabove with reference to Figs. 1–8.

[24281] VGAM557 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Spodoptera Exigua Nucleopolyhedrovirus. VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24282] VGAM557 gene encodes a VGAM557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM557 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM557 precursor RNA is designated SEQ ID:543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:543 is located at position 77506 relative to the genome of Spodoptera Exigua Nucleopolyhedrovirus.

[24283] VGAM557 precursor RNA folds onto itself, forming VGAM557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM557 folded precursor RNA into VGAM557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM557 RNA is designated SEQ ID:3268, and is provided hereinbelow with reference to the sequence listing part.

[24285] VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM557 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24286] VGAM557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM557 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM557 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24287] The complementary binding of VGAM557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM557 host tar-

get RNA into VGAM557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24288] It is appreciated that VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM557 host target genes. The mRNA of each one of this plurality of VGAM557 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM557 RNA, herein designated VGAM RNA, and which when bound by VGAM557 RNA causes inhibition of translation of respective one or more VGAM557 host target proteins.

[24289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM557 gene, herein designated VGAM GENE, on one or more VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24290] It is yet further appreciated that a function of VGAM557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM557 include diagnosis, prevention and treatment of viral infection by Spodoptera Exigua Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM557 correlate with, and may be deduced from, the identity of the host target genes which VGAM557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24291] Nucleotide sequences of the VGAM557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM557 are further

described hereinbelow with reference to Table 1.

[24292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM557 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24293] As mentioned hereinabove with reference to Fig. 1, a function of VGAM557 gene, herein designated VGAM is inhibition of expression of VGAM557 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM557 correlate with, and may be deduced from, the identity of the target genes which VGAM557 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24294] Phosphatase, Orphan 1 (phospho1, Accession XM\_091572) is a VGAM557 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of phospho1 BINDING SITE, designated SEQ ID:40063, to the nucleotide sequence of VGAM557 RNA, herein designated VGAM RNA, also designated SEQ ID:3268.

[24295] A function of VGAM557 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM\_091572). Accordingly, utilities of VGAM557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 558 (VGAM558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24296] VGAM558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM558 was detected is described hereinabove with reference to Figs. 1–8.

[24297] VGAM558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera Exigua Nucleopolyhedrovirus. VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[24298] VGAM558 gene encodes a VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM558 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM558 precursor RNA is designated SEQ ID:544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:544 is located at position 78942 relative to the genome of Spodoptera Exigua Nucleopolyhedrovirus.

[24299] VGAM558 precursor RNA folds onto itself, forming VGAM558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24300] An enzyme complex designated DICER COMPLEX, `dices` the VGAM558 folded precursor RNA into VGAM558 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM558 RNA is designated SEQ ID:3269, and is provided hereinbelow with reference to the sequence listing part.

[24301] VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM558 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24302] VGAM558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM558 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM558 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24303] The complementary binding of VGAM558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM558 host target RNA into VGAM558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24304] It is appreciated that VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM558 host target genes. The mRNA of each one of this plurality of VGAM558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM558 RNA, herein designated VGAM RNA, and which when bound by VGAM558 RNA causes inhibition of translation of respective one or more VGAM558 host target proteins.

[24305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM558 gene, herein designated VGAM GENE, on one or more VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24306] It is yet further appreciated that a function of VGAM558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of viral infection by Spodoptera Exigua Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM558 correlate with, and may be deduced from, the identity of the host target genes which VGAM558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24307] Nucleotide sequences of the VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM558 are further described hereinbelow with reference to Table 1.

[24308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM558 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24309] As mentioned hereinabove with reference to Fig. 1, a function of VGAM558 gene, herein designated VGAM is inhibition of expression of VGAM558 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM558 correlate with, and may be deduced from, the identity of the target genes which VGAM558 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24310] Activating Transcription Factor 7 (ATF7, Accession NM\_006856) is a VGAM558 host target gene. ATF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF7 BINDING SITE, designated SEQ ID:13727, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24311] A function of VGAM558 is therefore inhibition of Activating Transcription Factor 7 (ATF7, Accession NM\_006856). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF7. Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is another VGAM558 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14422 and SEQ ID:29090 respectively, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24312] Another function of VGAM558 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051) is another VGAM558 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22583, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24313] Another function of VGAM558 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Fibroblast Growth Factor 2 (basic) (FGF2, Ac-

cession NM\_002006) is another VGAM558 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7743, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24314] Another function of VGAM558 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM\_000165) is another VGAM558 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5680, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24315] Another function of VGAM558 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM\_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. Heparanase (HPSE, Accession NM\_006665) is another VGAM558 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13481,

to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24316] Another function of VGAM558 is therefore inhibition of Heparanase (HPSE, Accession NM\_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408) is another VGAM558 host target gene. MGAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8234, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24317] Another function of VGAM558 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935) is another VGAM558 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12573, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24318] Another function of VGAM558 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM\_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM558 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Nuclear Receptor Coactivator 6 Interacting Protein (NCOA6IP, Accession NM\_024831) is another VGAM558 host target gene. NCOA6IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA6IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6IP BINDING SITE, designated SEQ ID:24228, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24319] Another function of VGAM558 is therefore inhibition of Nuclear Receptor Coactivator 6 Interacting Protein (NCOA6IP, Accession NM\_024831). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6IP. RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650) is another

VGAM558 host target gene. RASA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASA1 BINDING SITE, designated SEQ ID:22906, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24320] Another function of VGAM558 is therefore inhibition of RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650), a gene which is involved in the control of cellular proliferation and differentiation. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASA1. The function of RASA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464. Ribonuclease, RNase A Family, 4 (RNASE4, Accession NM\_002937) is another VGAM558 host target gene. RNASE4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNASE4, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNASE4 BINDING SITE, designated SEQ ID:8838, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24321] Another function of VGAM558 is therefore inhibition of Ribonuclease, RNase A Family, 4 (RNASE4, Accession NM\_002937). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE4. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169) is another VGAM558 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18259, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24322] Another function of VGAM558 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Acces-

sion NM\_016169). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. TSLP (Accession NM\_138551) is another VGAM558 host target gene. TSLP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSLP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSLP BINDING SITE, designated SEQ ID:28849, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24323] Another function of VGAM558 is therefore inhibition of TSLP (Accession NM\_138551), a gene which may contribute directly to the activation of Langerhans cells and inhibit apoptosis. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSLP. The function of TSLP has been established by previous studies. By EST and genomic database screening for sequences similar to IL7, followed by screening a lung fibroblast sarcoma cDNA library, Reche et al. (2001) obtained a cDNA encoding TSLP. The deduced 159-amino acid protein, which is only 43%

identical to mouse Tslp, contains a 28-residue signal sequence, 6 cysteines, and 2 N-glycosylation sites. SDS-PAGE analysis showed expression of a 23-kD protein, larger than the predicted 15 kD, suggesting that TSLP is glycosylated. PCR analysis of a panel of cDNA libraries and cultured cell lines indicated that expression of a 1.3-kb TSLP transcript may be restricted to a few lung libraries. Reche et al. (2001) also identified TSLP receptor, which is composed of TSLPR (CRLF2; 300357) and IL7R (OMIM Ref. No. 146661) subunits. Dendritic cells (DCs) and monocytes coexpress IL7R and TSLPR. Quentmeier et al. (2001) also cloned and characterized TSLP. They noted the presence of 7 basic C-terminal amino acids (KKRRKRK) in the protein and that 6 of the 7 cysteines in the mouse protein (those involved in disulfide bond formation) are conserved in human, whereas the sites for N-glycosylation are distinct. Northern blot analysis revealed wide expression of an approximately 1.1-kb transcript, with highest levels in heart, liver, testis, and prostate. Reche et al. (2001) showed that incubation of DCs or monocytes with TSLP enhanced the expression of CCL17 (OMIM Ref. No. 601520), CCL18 (OMIM Ref. No. 603757), CCL22 (OMIM Ref. No. 602957), and CCL19 (OMIM Ref. No. 602227).

IL7, on the other hand, induced expression of CCL17, CCL22, and CCL19, but also CXCL8 (OMIM Ref. No. 146930), CXCL7 (OMIM Ref. No. 121010), CXCL5 (OMIM Ref. No. 600324), CXCL1 (OMIM Ref. No. 155730), CXCL2 (OMIM Ref. No. 139110), and CXCL3 (OMIM Ref. No. 139111). Functional analysis indicated that TSLP enhances the DC maturation process, as evidenced by upregulation of DC markers and costimulatory molecules and stronger T-cell proliferation. By screening myeloid cell lines, Quentmeier et al. (2001) established that an acute myeloid leukemia line, MUTZ-3, responds by proliferating in response to TSLP. TSLP also inhibited apoptosis in these cells. Proliferation in response to TSLP could not be attributed to the production of other growth factors tested and could be inhibited by relatively high concentrations of anti-IL7R. TSLP, like IL7, stimulated phosphorylation of STAT5 (OMIM Ref. No. 601511), but unlike IL7, it did not activate JAK3 (OMIM Ref. No. 600173). TSLP did not phosphorylate mitogen-activated protein kinases (e.g., ERK1; 601795). By flow cytometric analysis, Soumelis et al. (2002) showed that TSLP-activated DCs (TSLP-DCs) express higher levels of HLA-DR and DCLAMP (OMIM Ref. No. 605883) than do nonactivated or IL7-activated DCs,

and that TSLP–DCs induce marked proliferation and expansion of allogeneic naive CD4 (OMIM Ref. No. 186940)–positive T cells. Quantitative mRNA screening and ELISA analysis showed that TSLP–DCs do not produce detectable proinflammatory cytokines, but do produce high levels of TARC (CCL17) and MDC (CCL22) chemokines, which preferentially attract CCR4 (OMIM Ref. No. 604836)–expressing Th2 lymphocytes. TSLP–DCs induced CD4 cells to produce high amounts of IL13 (OMIM Ref. No. 147683), IL5 (OMIM Ref. No. 147850), and the proinflammatory cytokine tumor necrosis factor (TNF; 191160), but only low amounts of IL10 (OMIM Ref. No. 124092) and gamma–interferon (IFNG; 147570). RT–PCR analysis did not detect TSLP in most hemopoietic cells, the exception being mast cells. Keratinocytes, epithelial cells, smooth muscle cells, and lung fibroblasts also expressed high levels of TSLP. Within tonsils, highest levels were in crypt epithelial cells. Soumelis et al. (2002) suggested that TSLP may contribute to constitutive inflammation in this tissue and sporadic inflammation in squamous epithelium. Immunohistochemical analysis of allergic inflammatory tissue showed high expression of TSLP in keratinocytes of acute and chronic atopic dermatitis lesions, but no ex–

pression in normal skin. Strong TSLP expression in atopic dermatitis was associated with the disappearance of langerin (OMIM Ref. No. 604862)–positive Langerhans cells within the epidermis and the concurrent appearance of many DCLAMP–activated DCs within the dermis, many of which expressed langerin. Soumelis et al. (2002) proposed that TSLP expression by keratinocytes in atopic dermatitis lesions may contribute directly to the activation of Langerhans cells, which may migrate into the dermis and then the draining lymph nodes where they can prime allergen–specific Th2 responses.

[24324] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24325] Reche, P. A.; Soumelis, V.; Gorman, D. M.; Clifford, T.; Liu, M.; Travis, M.; Zurawski, S. M.; Johnston, J.; Liu, Y.–J.; Spits, H.; de Waal Malefyt, R.; Kastelein, R. A.; Bazan, J. F. : Human thymic stromal lymphopoietin preferentially stimulates myeloid cells. *J. Immun.* 167: 336–343, 2001. ; and

[24326] Soumelis, V.; Reche, P. A.; Kanzler, H.; Yuan, W.; Edward, G.; Homey, B.; Gilliet, M.; Ho, S.; Antonenko, S.; Lauerma, A.; Smith, K.; Gorman, D.; Zurawski, S.; Abrams, J.; Menon, S.; Mc.

[24327] Further studies establishing the function and utilities of TSLP are found in John Hopkins OMIM database record ID 607003, and in cited publications numbered 555 and 6729 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin-like 1 (sentrin) (UBL1, Accession NM\_003352) is another VGAM558 host target gene. UBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBL1 BINDING SITE, designated SEQ ID:9378, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24328] Another function of VGAM558 is therefore inhibition of Ubiquitin-like 1 (sentrin) (UBL1, Accession NM\_003352), a gene which generates proteins resistant to degradation through its modification. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL1. The function of UBL1 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM206. Von Hippel–Lindau Syndrome (VHL, Accession NM\_000551) is another VGAM558 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6161, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24329] Another function of VGAM558 is therefore inhibition of Von Hippel–Lindau Syndrome (VHL, Accession NM\_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197. ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656) is another VGAM558 host target gene.

ARFD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARFD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFD1 BINDING SITE, designated SEQ ID:7375, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24330] Another function of VGAM558 is therefore inhibition of ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFD1. Bromodomain Containing 4 (BRD4, Accession NM\_014299) is another VGAM558 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:15595, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA,

also designated SEQ ID:3269.

[24331] Another function of VGAM558 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM\_014299). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. DJ667H12.2 (Accession NM\_019605) is another VGAM558 host target gene. DJ667H12.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ667H12.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ667H12.2 BINDING SITE, designated SEQ ID:21218, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24332] Another function of VGAM558 is therefore inhibition of DJ667H12.2 (Accession NM\_019605). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ667H12.2. DKFZp547I224 (Accession NM\_020221) is another VGAM558 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21476, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24333] Another function of VGAM558 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. DKFZP566K1924 (Accession XM\_057469) is another VGAM558 host target gene. DKFZP566K1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36523, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24334] Another function of VGAM558 is therefore inhibition of DKFZP566K1924 (Accession XM\_057469). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. DKFZP586C1619 (Accession XM\_030350) is another VGAM558 host target gene. DKFZP586C1619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586C1619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586C1619 BINDING SITE, designated SEQ ID:31019, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24335] Another function of VGAM558 is therefore inhibition of DKFZP586C1619 (Accession XM\_030350). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1619. DRCTNNB1A (Accession NM\_032581) is another VGAM558 host target gene. DRCTNNB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DRCTNNB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRCTNNB1A BINDING SITE, designated SEQ ID:26317, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24336] Another function of VGAM558 is therefore inhibition of DRCTNNB1A (Accession NM\_032581). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRCTNNB1A. ELL2 (Accession NM\_012081) is another VGAM558 host target gene. ELL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL2 BINDING SITE, designated SEQ ID:14369, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24337] Another function of VGAM558 is therefore inhibition of ELL2 (Accession NM\_012081). Accordingly, utilities of

VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL2.

FLJ10199 (Accession XM\_048840) is another VGAM558 host target gene. FLJ10199 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10199 BINDING SITE, designated SEQ ID:35286, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24338] Another function of VGAM558 is therefore inhibition of FLJ10199 (Accession XM\_048840). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10199. FLJ12650 (Accession NM\_024522) is another VGAM558 host target gene. FLJ12650 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12650 BINDING SITE,

designated SEQ ID:23723, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24339] Another function of VGAM558 is therefore inhibition of FLJ12650 (Accession NM\_024522). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12650. FLJ13189 (Accession NM\_024882) is another VGAM558 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24333, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24340] Another function of VGAM558 is therefore inhibition of FLJ13189 (Accession NM\_024882). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189. FLJ14054 (Accession NM\_024563) is another VGAM558 host target gene. FLJ14054 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23786, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24341] Another function of VGAM558 is therefore inhibition of FLJ14054 (Accession NM\_024563). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. FLJ20093 (Accession NM\_017664) is another VGAM558 host target gene. FLJ20093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20093 BINDING SITE, designated SEQ ID:19205, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24342] Another function of VGAM558 is therefore inhibition of

FLJ20093 (Accession NM\_017664). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20093. FLJ20793 (Accession XM\_166296) is another VGAM558 host target gene. FLJ20793 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20793 BINDING SITE, designated SEQ ID:44111, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24343] Another function of VGAM558 is therefore inhibition of FLJ20793 (Accession XM\_166296). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20793. KIAA0367 (Accession XM\_041018) is another VGAM558 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33419, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24344] Another function of VGAM558 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_006599) is another VGAM558 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:13378, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24345] Another function of VGAM558 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_006599). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NFAT5. PRO1386 (Accession NM\_031269) is another VGAM558 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:25293, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24346] Another function of VGAM558 is therefore inhibition of PRO1386 (Accession NM\_031269). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. RRN3 (Accession NM\_018427) is another VGAM558 host target gene. RRN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRN3 BINDING SITE, designated SEQ ID:20490, to the nucleotide sequence of VGAM558 RNA,

herein designated VGAM RNA, also designated SEQ ID:3269.

[24347] Another function of VGAM558 is therefore inhibition of RRN3 (Accession NM\_018427). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRN3. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM\_033285) is another VGAM558 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27107 and SEQ ID:36117 respectively, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24348] Another function of VGAM558 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM\_033285). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1.

LOC120892 (Accession XM\_058513) is another VGAM558 host target gene. LOC120892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120892 BINDING SITE, designated SEQ ID:36649, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24349] Another function of VGAM558 is therefore inhibition of LOC120892 (Accession XM\_058513). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120892. LOC130612 (Accession XM\_059461) is another VGAM558 host target gene. LOC130612 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:36998, to the nucleotide sequence of VGAM558 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3269.

[24350] Another function of VGAM558 is therefore inhibition of LOC130612 (Accession XM\_059461). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612. LOC145828 (Accession XM\_096879) is another VGAM558 host target gene. LOC145828 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145828 BINDING SITE, designated SEQ ID:40613, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24351] Another function of VGAM558 is therefore inhibition of LOC145828 (Accession XM\_096879). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145828. LOC147341 (Accession XM\_097223) is another VGAM558 host target gene. LOC147341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147341, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147341 BINDING SITE, designated SEQ ID:40828, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24352] Another function of VGAM558 is therefore inhibition of LOC147341 (Accession XM\_097223). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147341. LOC149175 (Accession XM\_086445) is another VGAM558 host target gene. LOC149175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149175 BINDING SITE, designated SEQ ID:38660, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24353] Another function of VGAM558 is therefore inhibition of LOC149175 (Accession XM\_086445). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC149175. LOC149650 (Accession XM\_086623) is another VGAM558 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38797, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24354] Another function of VGAM558 is therefore inhibition of LOC149650 (Accession XM\_086623). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC152762 (Accession XM\_087518) is another VGAM558 host target gene. LOC152762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152762 BINDING SITE, designated SEQ ID:39308, to

the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24355] Another function of VGAM558 is therefore inhibition of LOC152762 (Accession XM\_087518). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152762. LOC196528 (Accession XM\_113745) is another VGAM558 host target gene. LOC196528 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196528 BINDING SITE, designated SEQ ID:42406, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24356] Another function of VGAM558 is therefore inhibition of LOC196528 (Accession XM\_113745). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196528. LOC221876 (Accession XM\_168220) is another VGAM558 host target gene. LOC221876 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221876 BINDING SITE, designated SEQ ID:45080, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24357] Another function of VGAM558 is therefore inhibition of LOC221876 (Accession XM\_168220). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221876. LOC254042 (Accession XM\_171022) is another VGAM558 host target gene. LOC254042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254042 BINDING SITE, designated SEQ ID:45794, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24358] Another function of VGAM558 is therefore inhibition of LOC254042 (Accession XM\_171022). Accordingly, utilities

of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254042. LOC255446 (Accession XM\_173154) is another VGAM558 host target gene. LOC255446 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255446 BINDING SITE, designated SEQ ID:46409, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24359] Another function of VGAM558 is therefore inhibition of LOC255446 (Accession XM\_173154). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255446. LOC257017 (Accession XM\_173227) is another VGAM558 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257017 BINDING SITE, designated SEQ ID:46500, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24360] Another function of VGAM558 is therefore inhibition of LOC257017 (Accession XM\_173227). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC51644 (Accession NM\_016057) is another VGAM558 host target gene. LOC51644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51644 BINDING SITE, designated SEQ ID:18132, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24361] Another function of VGAM558 is therefore inhibition of LOC51644 (Accession NM\_016057). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51644. LOC92360 (Accession XM\_044589) is another VGAM558 host target gene. LOC92360 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92360 BINDING SITE, designated SEQ ID:34241, to the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, also designated SEQ ID:3269.

[24362] Another function of VGAM558 is therefore inhibition of LOC92360 (Accession XM\_044589). Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92360. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 559 (VGAM559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24363] VGAM559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM559 was detected is described hereinabove with reference to Figs. 1-8.

[24364] VGAM559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24365] VGAM559 gene encodes a VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM559 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM559 precursor RNA is designated SEQ ID:545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:545 is located at position 19237 relative to the genome of Fowlpox Virus.

[24366] VGAM559 precursor RNA folds onto itself, forming VGAM559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[24367] An enzyme complex designated DICER COMPLEX, `dices` the VGAM559 folded precursor RNA into VGAM559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM559 RNA is designated SEQ ID:3270, and is provided hereinbelow with reference to the sequence listing part.

[24368] VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM559 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24369] VGAM559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM559 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM559 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24370] The complementary binding of VGAM559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM559 host target RNA into VGAM559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24371] It is appreciated that VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM559 host target genes. The mRNA of each one of this plurality of VGAM559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM559 RNA, herein designated VGAM RNA, and which when bound by VGAM559 RNA causes inhibition of translation of respective one or more VGAM559 host target proteins.

[24372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM559 gene, herein designated VGAM GENE, on one or more VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24373] It is yet further appreciated that a function of VGAM559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM559 correlate with, and may be deduced from, the identity of the host target genes which VGAM559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24374] Nucleotide sequences of the VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM559 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM559 are further described hereinbelow with reference to Table 1.

[24375] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM559 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24376] As mentioned hereinabove with reference to Fig. 1, a function of VGAM559 gene, herein designated VGAM is inhibition of expression of VGAM559 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM559 correlate with, and may be deduced from, the identity of the target genes which VGAM559 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24377] Dyskeratosis Congenita 1, Dyskerin (DKC1, Accession NM\_001363) is a VGAM559 host target gene. DKC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of DKC1 BINDING SITE, designated SEQ ID:7044, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24378] A function of VGAM559 is therefore inhibition of Dyskeratosis Congenita 1, Dyskerin (DKC1, Accession NM\_001363), a gene which may have cell cycle and nucleolar functions. Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKC1. The function of DKC1 has been established by previous studies. Heiss et al. (1998) demonstrated missense mutations in the DKC1 gene that correlated with dyskeratosis congenita. The disease is characterized by the early manifestation of reticulate skin pigmentation, nail dystrophy, and mucosal leukoplakia. Progressive bone marrow failure occurs in over 80% of cases and is the main cause of early mortality. Variability in the age of onset, severity of bone marrow failure, and range of congenital abnormalities was observed. An increased risk of developing different types of malignancies also exists. Chromosomal instability is indicated by the keratin chromosomal aberrations in skin fibroblast cell cultures and bone marrow metaphases. In

contrast to patients with Fanconi anemia (OMIM Ref. No. 227650), lymphocytes from DKC patients do not show an increased sensitivity to clastogens. Females heterozygous for the mutant gene showed a skewed pattern of X-chromosome inactivation consistent with the gene defect giving rise to a proliferation and/or survival disadvantage in those cells expressing it. By positional cloning, Heiss et al. (1998) identified a gene, symbolized DKC1, in the Xq28 region that is the cause of X-linked recessive dyskeratosis congenita (DKC; 305000). Heiss et al. (1998) found that the DKC1 gene is highly conserved across species barriers and is the ortholog of rat NAP57 and *S. cerevisiae* Cbf5. The gene product, referred to as dyskerin, contains 2 TruB pseudouridine synthase motifs, multiple phosphorylation sites, and a carboxy-terminal lysine-rich domain. By analogy to the function of known dyskerin orthologs, Heiss et al. (1998) predicted that dyskerin is involved in the cell cycle and nucleolar function.

[24379] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24380] Heiss, N. S.; Knight, S. W.; Vulliamy, T. J.; Klauck, S. M.;

Wiemann, S.; Mason, P. J.; Poustka, A.; Dokal, I. : X-linked dyskeratosis congenita is caused by mutations in a highly conserved gene with putative nucleolar functions. *Nature Genet.* 19: 32–38, 1998. ; and

[24381] Heiss, N. S.; Megarbane, A.; Klauck, S. M.; Kreuz, F. R.; Makhoul, E.; Majewski, F.; Poustka, A. : One novel and two recurrent missense DKC1 mutations in patients with dyskeratosis cong.

[24382] Further studies establishing the function and utilities of DKC1 are found in John Hopkins OMIM database record ID 300126, and in cited publications numbered 9154–915 and 10979–10987 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM\_000843) is another VGAM559 host target gene. GRM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:6513, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24383] Another function of VGAM559 is therefore inhibition of Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM\_000843). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071) is another VGAM559 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15294, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24384] Another function of VGAM559 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM\_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM25.Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 3 (SLC11A3, Accession NM\_014585) is another VGAM559 host target gene. SLC11A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC11A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A3 BINDING SITE, designated SEQ ID:15943, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24385] Another function of VGAM559 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 3 (SLC11A3, Accession NM\_014585). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A3. ESDN (Accession NM\_080927) is another VGAM559 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28156, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24386] Another function of VGAM559 is therefore inhibition of ESDN (Accession NM\_080927). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. FLJ20445 (Accession NM\_017824) is another VGAM559 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19484, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24387] Another function of VGAM559 is therefore inhibition of FLJ20445 (Accession NM\_017824). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445.

FLJ23510 (Accession NM\_024720) is another VGAM559 host target gene. FLJ23510 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:24054, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24388] Another function of VGAM559 is therefore inhibition of FLJ23510 (Accession NM\_024720). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510. KIAA0179 (Accession XM\_035973) is another VGAM559 host target gene. KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:32366, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3270.

[24389] Another function of VGAM559 is therefore inhibition of KIAA0179 (Accession XM\_035973). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA1535 (Accession XM\_086565) is another VGAM559 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38769, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24390] Another function of VGAM559 is therefore inhibition of KIAA1535 (Accession XM\_086565). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. Kv6.3 (Accession NM\_133490) is another VGAM559 host target gene. Kv6.3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Kv6.3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Kv6.3 BINDING SITE, designated SEQ ID:28568, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24391] Another function of VGAM559 is therefore inhibition of Kv6.3 (Accession NM\_133490). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Kv6.3. PFTAIRE Protein Kinase 1 (PFTK1, Accession NM\_012395) is another VGAM559 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14757, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24392] Another function of VGAM559 is therefore inhibition of PFTAIRE Protein Kinase 1 (PFTK1, Accession NM\_012395). Accordingly, utilities of VGAM559 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PFTK1. LOC139522 (Accession XM\_066738) is another VGAM559 host target gene. LOC139522 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC139522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139522 BINDING SITE, designated SEQ ID:37345, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24393] Another function of VGAM559 is therefore inhibition of LOC139522 (Accession XM\_066738). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139522. LOC196485 (Accession XM\_113731) is another VGAM559 host target gene. LOC196485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196485 BINDING SITE, designated SEQ ID:42381, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24394] Another function of VGAM559 is therefore inhibition of LOC196485 (Accession XM\_113731). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196485. LOC202986 (Accession XM\_117489) is another VGAM559 host target gene. LOC202986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202986 BINDING SITE, designated SEQ ID:43472, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24395] Another function of VGAM559 is therefore inhibition of LOC202986 (Accession XM\_117489). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202986. LOC203378 (Accession XM\_117541) is another VGAM559 host target gene. LOC203378 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43556, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24396] Another function of VGAM559 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC257106 (Accession XM\_170910) is another VGAM559 host target gene. LOC257106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257106 BINDING SITE, designated SEQ ID:45679, to the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, also designated SEQ ID:3270.

[24397] Another function of VGAM559 is therefore inhibition of

LOC257106 (Accession XM\_170910). Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257106. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 560 (VGAM560) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24398] VGAM560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM560 was detected is described hereinabove with reference to Figs. 1–8.

[24399] VGAM560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24400] VGAM560 gene encodes a VGAM560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM560 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM560 precursor RNA is designated SEQ ID:546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:546 is located at position 23914 relative to the genome of Fowlpox Virus.

[24401] VGAM560 precursor RNA folds onto itself, forming VGAM560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24402] An enzyme complex designated DICER COMPLEX, `dices` the VGAM560 folded precursor RNA into VGAM560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM560 RNA is designated SEQ ID:3271, and is provided hereinbelow with reference to the sequence listing part.

[24403] VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM560 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24404] VGAM560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM560 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24405] The complementary binding of VGAM560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM560 host target RNA into VGAM560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24406] It is appreciated that VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM560 host target genes. The mRNA of each one of this plurality of VGAM560 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM560 RNA, herein designated VGAM RNA, and which when bound by VGAM560 RNA causes inhibition of translation of respective one or more VGAM560 host target proteins.

[24407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM560 gene, herein designated VGAM GENE, on one or more VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24408] It is yet further appreciated that a function of VGAM560 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM560 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM560 correlate with, and may be deduced from, the identity of the host target genes which VGAM560 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24409] Nucleotide sequences of the VGAM560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM560 are further described hereinbelow with reference to Table 1.

[24410] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM560 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24411] As mentioned hereinabove with reference to Fig. 1, a function of VGAM560 gene, herein designated VGAM is inhibition of expression of VGAM560 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM560 correlate with, and may be deduced from, the identity of the target genes which VGAM560 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24412] SB52 (Accession NM\_138335) is a VGAM560 host target gene. SB52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SB52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SB52 BINDING SITE, designated SEQ ID:28733, to the nucleotide sequence of VGAM560 RNA, herein designated VGAM RNA, also designated SEQ ID:3271.

[24413] A function of VGAM560 is therefore inhibition of SB52 (Accession NM\_138335). Accordingly, utilities of VGAM560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SB52. Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929) is another VGAM560

host target gene. UHRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UHRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF2 BINDING SITE, designated SEQ ID:36353, to the nucleotide sequence of VGAM560 RNA, herein designated VGAM RNA, also designated SEQ ID:3271.

[24414] Another function of VGAM560 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929). Accordingly, utilities of VGAM560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF2. LOC50999 (Accession NM\_016040) is another VGAM560 host target gene. LOC50999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC50999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC50999 BINDING SITE, designated SEQ ID:18117, to the nucleotide sequence of VGAM560 RNA, herein designated VGAM RNA,

also designated SEQ ID:3271.

[24415] Another function of VGAM560 is therefore inhibition of LOC50999 (Accession NM\_016040). Accordingly, utilities of VGAM560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC50999. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 561 (VGAM561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24416] VGAM561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM561 was detected is described hereinabove with reference to Figs. 1–8.

[24417] VGAM561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24418] VGAM561 gene encodes a VGAM561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM561 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM561 precursor RNA is designated SEQ ID:547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:547 is located at position 33749 relative to the genome of Fowlpox Virus.

[24419] VGAM561 precursor RNA folds onto itself, forming VGAM561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM561 folded precursor RNA into VGAM561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM561 RNA is designated SEQ ID:3272, and is provided hereinbelow with reference to the sequence listing part.

[24421] VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM561 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24422] VGAM561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM561 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24423] The complementary binding of VGAM561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM561 host target RNA into VGAM561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24424] It is appreciated that VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM561 host target genes. The mRNA of

each one of this plurality of VGAM561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM561 RNA, herein designated VGAM RNA, and which when bound by VGAM561 RNA causes inhibition of translation of respective one or more VGAM561 host target proteins.

[24425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM561 gene, herein designated VGAM GENE, on one or more VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[24426] It is yet further appreciated that a function of VGAM561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM561 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM561 correlate with, and may be deduced from, the identity of the host target genes which VGAM561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24427] Nucleotide sequences of the VGAM561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM561 are further described hereinbelow with reference to Table 1.

[24428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM561 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM561 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[24429] As mentioned hereinabove with reference to Fig. 1, a function of VGAM561 gene, herein designated VGAM is inhibition of expression of VGAM561 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM561 correlate with, and may be deduced from, the identity of the target genes which VGAM561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24430] BLAME (Accession NM\_020125) is a VGAM561 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21305, to the nucleotide sequence of VGAM561 RNA, herein designated VGAM RNA, also designated SEQ ID:3272.

[24431] A function of VGAM561 is therefore inhibition of BLAME (Accession NM\_020125). Accordingly, utilities of VGAM561 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BLAME. LOC90342 (Accession XM\_031009) is another VGAM561 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31252, to the nucleotide sequence of VGAM561 RNA, herein designated VGAM RNA, also designated SEQ ID:3272.

[24432] Another function of VGAM561 is therefore inhibition of LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 562 (VGAM562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24433] VGAM562 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM562 was detected is described hereinabove with reference to Figs. 1–8.

[24434] VGAM562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24435] VGAM562 gene encodes a VGAM562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM562 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM562 precursor RNA is designated SEQ ID:548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:548 is located at position 81779 relative to the genome of Fowlpox Virus.

[24436] VGAM562 precursor RNA folds onto itself, forming VGAM562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24437] An enzyme complex designated DICER COMPLEX, `dices` the VGAM562 folded precursor RNA into VGAM562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM562 RNA is designated SEQ ID:3273, and is provided hereinbelow with reference to the sequence listing part.

[24438] VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM562 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24439] VGAM562 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM562 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24440] The complementary binding of VGAM562 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM562 host target RNA into VGAM562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24441] It is appreciated that VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM562 host target genes. The mRNA of each one of this plurality of VGAM562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM562 RNA, herein designated VGAM RNA, and which when bound by VGAM562 RNA causes inhibition of translation of respective one or more VGAM562 host target proteins.

[24442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM562 gene, herein designated VGAM GENE, on one or more VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24443] It is yet further appreciated that a function of VGAM562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM562 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM562 correlate with, and may be deduced from, the identity of the host target genes which VGAM562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24444] Nucleotide sequences of the VGAM562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM562 are further described hereinbelow with reference to Table 1.

[24445] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM562 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24446] As mentioned hereinabove with reference to Fig. 1, a function of VGAM562 gene, herein designated VGAM is inhibition of expression of VGAM562 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM562 correlate with, and may be deduced from, the identity of the target genes which VGAM562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24447] BCRP2 (Accession XM\_031102) is a VGAM562 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31278, to the nucleotide sequence of VGAM562 RNA, herein designated VGAM RNA, also designated SEQ ID:3273.

[24448] A function of VGAM562 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM\_002015) is another VGAM562 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7757, to the nucleotide sequence of VGAM562 RNA, herein designated VGAM RNA, also designated SEQ ID:3273.

[24449] Another function of VGAM562 is therefore inhibition of

Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM\_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228. Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432) is another VGAM562 host target gene. IL20RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL20RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL20RA BINDING SITE, designated SEQ ID:15789, to the nucleotide sequence of VGAM562 RNA, herein designated VGAM RNA, also designated SEQ ID:3273.

[24450] Another function of VGAM562 is therefore inhibition of Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432), a gene which is the receptor for interleukin-20 . Accordingly, utilities of VGAM562 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with IL20RA. The function of IL20RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. TACTILE (Accession NM\_005816) is another VGAM562 host target gene. TACTILE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACTILE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE BINDING SITE, designated SEQ ID:12408, to the nucleotide sequence of VGAM562 RNA, herein designated VGAM RNA, also designated SEQ ID:3273.

[24451] Another function of VGAM562 is therefore inhibition of TACTILE (Accession NM\_005816). Accordingly, utilities of VGAM562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 563 (VGAM563) viral gene, which modulates expression of

respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24452] VGAM563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM563 was detected is described hereinabove with reference to Figs. 1–8.

[24453] VGAM563 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24454] VGAM563 gene encodes a VGAM563 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM563 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM563 precursor RNA is designated SEQ ID:549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:549 is located at position 82125 relative to the genome of Fowlpox Virus.

[24455] VGAM563 precursor RNA folds onto itself, forming VGAM563 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[24456] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM563 folded precursor RNA into VGAM563 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 56%) nucleotide se-  
quence of VGAM563 RNA is designated SEQ ID:3274, and  
is provided hereinbelow with reference to the sequence  
listing part.

[24457] VGAM563 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM563 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM563 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24458] VGAM563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM563 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24459] The complementary binding of VGAM563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM563 host target RNA into VGAM563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24460] It is appreciated that VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM563 host target genes. The mRNA of each one of this plurality of VGAM563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM563 RNA, herein designated VGAM RNA, and which when bound by VGAM563 RNA causes inhibition of translation of respective one or more VGAM563 host target proteins.

[24461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM563 gene, herein designated VGAM GENE, on one or more VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24462] It is yet further appreciated that a function of VGAM563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM563 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM563 correlate with, and may be deduced from, the identity of the host target genes which VGAM563 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [24463] Nucleotide sequences of the VGAM563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM563 are further described hereinbelow with reference to Table 1.
- [24464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM563 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [24465] As mentioned hereinabove with reference to Fig. 1, a function of VGAM563 gene, herein designated VGAM is inhibition of expression of VGAM563 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM563 correlate with, and may be deduced from, the identity of the target genes which VGAM563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24466] Nuclear Receptor Subfamily 2, Group F, Member 2 (NR2F2, Accession NM\_021005) is a VGAM563 host target gene. NR2F2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR2F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2F2 BINDING SITE, designated SEQ ID:22001, to the nucleotide sequence of VGAM563 RNA, herein designated VGAM RNA, also designated SEQ ID:3274.

[24467] A function of VGAM563 is therefore inhibition of Nuclear Receptor Subfamily 2, Group F, Member 2 (NR2F2, Accession NM\_021005), a gene which is the regulation of the apolipoprotein ai gene transcription. Accordingly, utilities of VGAM563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2F2. The function of NR2F2 has been established by previous studies. Hepatocyte-specific expression of the human apolipoprotein A-I gene (OMIM Ref. No. 107680) is dependent on synergistic actions between nuclear proteins bound to distinct sites within a liver-specific enhancer located upstream of the APOA1 transcription start site

(Widom et al., 1991). From analysis of the cDNA-derived amino acid sequence, Ladas and Karathanasis (1991) found that one of these proteins, apolipoprotein regulatory protein I, is a novel member of the steroid/thyroid nuclear receptor of ligand-dependent transcription factors. Using a 3.9-kb fragment, Modi et al. (1991) assigned the NR2F2 gene to 15q26.1–q26.2 by Southern analysis of human–rodent somatic cell hybrid DNAs and in situ chromosomal hybridization. Chicken ovalbumin upstream promoter transcription factors (COUP-TFs) are members of the steroid/thyroid hormone receptor superfamily. They are often called orphan receptors, since their ligands have not been identified. COUP-TF homologs have been cloned in many species, from *Drosophila* to human. The protein sequences are highly homologous across species, suggesting functional conservation. ARP1, also called COUP-TFII, and COUP-TFI (OMIM Ref. No. 132890), were cloned from the human and their genomic organization characterized. Qiu et al. (1995) isolated the mouse genes encoding COUP-TFs I and II and characterized their genomic structures. Both have relatively simple structures similar to those of their human counterparts. Qiu et al. (1995) used interspecific backcross analysis to map *Tcfcoup1* to

mouse chromosome 13 and Tcf coup2 to mouse chromosome 7. By isotopic in situ hybridization, they mapped the human counterparts to 5q14 and 15q26, in regions that show homology of synteny between mouse and human. The previous assignment of the so-called ARP1 gene was confirmed.

- [24468] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [24469] Qiu, Y.; Krishnan, V.; Zeng, Z.; Gilbert, D. J.; Copeland, N. G.; Gibson, L.; Yang-Feng, T.; Jenkins, N. A.; Tsai, M.-J.; Tsai, S. Y. : Isolation, characterization, and chromosomal localization of mouse and human COUP-TF I and II genes. Genomics 29: 240–246, 1995. ; and

- [24471] Further studies establishing the function and utilities of NR2F2 are found in John Hopkins OMIM database record ID 107773, and in cited publications numbered 12069, 12071–12072, 402 and 12073 listed in the bibliography section hereinbelow, which are also hereby incorporated

by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 564 (VGAM564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24472] VGAM564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM564 was detected is described hereinabove with reference to Figs. 1–8.

[24473] VGAM564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24474] VGAM564 gene encodes a VGAM564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM564 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM564 precursor RNA is designated SEQ ID:550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:550 is located at position 81158 relative to the genome of Fowlpox Virus.

[24475] VGAM564 precursor RNA folds onto itself, forming VGAM564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[24476] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM564 folded precursor RNA into VGAM564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM564 RNA is designated SEQ ID:3275, and is provided hereinbelow with reference to the sequence listing part.

[24477] VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM564 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[24478] VGAM564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM564 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24479] The complementary binding of VGAM564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM564 host target RNA into VGAM564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24480] It is appreciated that VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM564 host target genes. The mRNA of each one of this plurality of VGAM564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM564 RNA, herein designated VGAM RNA, and which when bound by VGAM564 RNA causes inhibition of translation of respective one or more VGAM564 host target proteins.

[24481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM564 gene, herein designated VGAM GENE, on one or more VGAM564 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24482] It is yet further appreciated that a function of VGAM564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM564 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM564 correlate with, and may be deduced from, the identity of the host target genes which VGAM564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24483] Nucleotide sequences of the VGAM564 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM564 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM564 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM564 are further  
described hereinbelow with reference to Table 1.

[24484] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM564 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM564 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[24485] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM564 gene, herein designated VGAM is  
inhibition of expression of VGAM564 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM564 correlate with, and may be deduced  
from, the identity of the target genes which VGAM564  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[24486] Deducator of Cyto-kinesis 1 (DOCK1, Accession  
NM\_001380) is a VGAM564 host target gene. DOCK1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK1 BINDING SITE, designated SEQ ID:7050, to the nucleotide sequence of VGAM564 RNA, herein designated VGAM RNA, also designated SEQ ID:3275.

[24487] A function of VGAM564 is therefore inhibition of Dedicator of Cytokinesis 1 (DOCK1, Accession NM\_001380), a gene which may function in the extension of cell surfaces. Accordingly, utilities of VGAM564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK1. The function of DOCK1 has been established by previous studies. The CRK protein (OMIM Ref. No. 164762), comprised mostly of SH2 and SH3 src-homology domains, has an important role in signaling from focal adhesions. Along with other adaptor proteins such as GRB2 (OMIM Ref. No. 108355) and NCK (OMIM Ref. No. 600508), it receives signals through its SH2 domains from phosphotyrosine-containing peptides and transfers them to other proteins bound to its SH3 domains. Among proteins that bind to the SH3 domain of

CRK are C3G (OMIM Ref. No. 600303), a guanine nucleotide exchange protein for RAP1 (OMIM Ref. No. 600278), and the 180-kD DOCK (downstream of CRK) protein. Hasegawa et al. (1996) isolated a cDNA for DOCK by screening an expression library with CRK SH3. They found a full-length cDNA that encodes a putative 1,866-amino acid polypeptide with an SH3 domain at its amino end. Northern blots showed a 7.6-kb transcript that was expressed in most tissues and most strongly in placenta, lungs, kidney, and pancreas. Wildtype DOCK180 was found in the cytoplasm and did not affect cell morphology. However, when farnesylated, the protein became associated with the cytoplasmic membrane and made spindle 3T3 cells become flattened and polygonal. Takai et al. (1996) mapped DOCK180 to 10q26.13-q26.3 by fluorescence in situ hybridization. During programmed cell death (apoptosis), cell corpses are rapidly engulfed. This engulfment process involves the recognition and subsequent phagocytosis of cell corpses by engulfing cells. Wu and Horvitz (1998) shed light on the previously obscure mechanisms by which cell corpses are engulfed. They reported that *ced-5*, a gene that is required for cell-corpse engulfment in the nematode *Caenorhabditis ele-*

gans, encodes a protein that is similar to the human protein DOCK180 and the *Drosophila melanogaster* protein Myoblast City (MBC), both of which had been implicated in the extension of cell surfaces. *C. elegans* ced-5 mutants were defective not only in the engulfment of cell corpses but also in the migrations of 2 specific gonadal cells, the distal tip cells. The expression of human DOCK180 in *C. elegans* rescued the cell-migration defect of a ced-5 mutant. Wu and Horvitz (1998) presented evidence that ced-5 functions in engulfing cells during the engulfment of cell corpses. They suggested that ced-5 acts in the extension of the surface of an engulfing cell around a dying cell during programmed cell death. They named the new family of proteins that function in the extension of cell surfaces the CDM (for CED-5, DOCK180, and MBC) family.

[24488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24489] Savill, J. : Phagocytic docking without shocking. *Nature* 442-443, 1998. ; and

[24490] Takai, S.; Hasegawa, H.; Kiyokawa, E.; Yamada, K.; Kurata, T.; Matsuda, M. : Chromosomal mapping of the gene encoding DOCK180, a major Crk-binding protein, to

10q26.13–q26.3 by fluoresc.

[24491] Further studies establishing the function and utilities of DOCK1 are found in John Hopkins OMIM database record ID 601403, and in cited publications numbered 6497–6500 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC146452 (Accession XM\_085473) is another VGAM564 host target gene. LOC146452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146452 BINDING SITE, designated SEQ ID:38162, to the nucleotide sequence of VGAM564 RNA, herein designated VGAM RNA, also designated SEQ ID:3275.

[24492] Another function of VGAM564 is therefore inhibition of LOC146452 (Accession XM\_085473). Accordingly, utilities of VGAM564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146452. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 565 (VGAM565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24493] VGAM565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM565 was detected is described hereinabove with reference to Figs. 1–8.

[24494] VGAM565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24495] VGAM565 gene encodes a VGAM565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM565 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM565 precursor RNA is designated SEQ ID:551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:551 is located at position 104297 relative to the genome of Fowlpox Virus.

[24496] VGAM565 precursor RNA folds onto itself, forming VGAM565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24497] An enzyme complex designated DICER COMPLEX, `dices` the VGAM565 folded precursor RNA into VGAM565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM565 RNA is designated SEQ ID:3276, and is provided hereinbelow with reference to the sequence listing part.

[24498] VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM565 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM565 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24499] VGAM565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM565 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24500] The complementary binding of VGAM565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM565 host target RNA into VGAM565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24501] It is appreciated that VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM565 host target genes. The mRNA of each one of this plurality of VGAM565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM565 RNA, herein designated VGAM RNA, and which when bound by VGAM565 RNA causes inhibition of translation of respective one or more VGAM565 host target proteins.

[24502] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM565 gene, herein designated VGAM GENE, on one or more VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24503] It is yet further appreciated that a function of VGAM565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM565 correlate with, and may be deduced from, the identity of the host

target genes which VGAM565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24504] Nucleotide sequences of the VGAM565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM565 are further described hereinbelow with reference to Table 1.

[24505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM565 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24506] As mentioned hereinabove with reference to Fig. 1, a function of VGAM565 gene, herein designated VGAM is inhibition of expression of VGAM565 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM565 correlate with, and may be deduced from, the identity of the target genes which VGAM565

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24507] Aldehyde Dehydrogenase 1 Family, Member A3

(ALDH1A3, Accession NM\_000693) is a VGAM565 host target gene. ALDH1A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1A3 BINDING SITE, designated SEQ ID:6352, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24508] A function of VGAM565 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM\_000693), a gene which plays a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1A3. The function of ALDH1A3 has been established by previous studies. Hsu et al. (1994) identified and characterized the ALDH6 gene. The existence of this unique

ALDH isozyme in human saliva and its polymorphism had previously been demonstrated. The ALDH6 cDNA is 3,457 bp long and contains an open reading frame encoding 512 amino acids. The deduced amino acid sequence shows that the protein is larger than human liver ALDH1 (OMIM Ref. No. 100640) by 11 residues at the N terminus, and the degree of identity between the 2 isozymes is 70% with an alignment of 500 amino acid residues. Northern blot analysis demonstrated that the ALDH6 gene is expressed at low levels in many tissues and at higher levels in salivary gland, stomach, and kidney. By in situ hybridization of chick and mouse embryos, Grun et al. (2000) demonstrated expression of Aldh1a3 in the developing sensory neuroepithelia of the eye, nose, and ear, and in discrete sites within the central nervous system. Expression of chick Aldh1a3 in a human choriocarcinoma cell line conferred increased sensitivity to retinol in a retinoic acid receptor (see OMIM Ref. No. 180240)-dependent reporter assay. GENE STRUCTURE Hsu et al. (1994) determined that the ALDH6 gene spans about 37 kb and contains 13 exons. Putative TATA and CCAAT boxes and Sp1 binding sites were found in the 5-prime upstream region of the gene.

- [24509] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [24510] Grun, F.; Hirose, Y.; Kawauchi, S.; Ogura, T.; Umesono, K. : Aldehyde dehydrogenase 6, a cytosolic retinaldehyde dehydrogenase prominently expressed in sensory neuroepithelia during development. J. Biol. Chem. 275: 41210–41218, 2000. ; and
- [24511] Hsu, L. C.; Chang, W.-C.; Hiraoka, L.; Hsieh, C.-L. : Molecular cloning, genomic organization, and chromosomal localization of an additional human aldehyde dehydrogenase gene, ALDH6. G.
- [24512] Further studies establishing the function and utilities of ALDH1A3 are found in John Hopkins OMIM database record ID 600463, and in cited publications numbered 1613–1614 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glial Fibrillary Acidic Protein (GFAP, Accession NM\_002055) is another VGAM565 host target gene. GFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:7816, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24513] Another function of VGAM565 is therefore inhibition of Glial Fibrillary Acidic Protein (GFAP, Accession NM\_002055). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP. Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM\_006246) is another VGAM565 host target gene. PPP2R5E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5E BINDING SITE, designated SEQ ID:12920, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24514] Another function of VGAM565 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM\_006246), a gene which

is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5E. The function of PPP2R5E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302. Prolactin Regulatory Element Binding (PREB, Accession NM\_013388) is another VGAM565 host target gene. PREB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PREB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PREB BINDING SITE, designated SEQ ID:15038, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24515] Another function of VGAM565 is therefore inhibition of Prolactin Regulatory Element Binding (PREB, Accession NM\_013388), a gene which is a WD motif DNA-binding protein and involved in transcriptional regulation. Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with PREB. The function of PREB has been established by previous studies. Fliss et al. (1999) isolated a rat cDNA encoding Preb, a WD motif DNA-binding protein with the capacity to regulate prolactin (PRL; 176760) promoter activity. Northern blot analysis of human tissues using a rat Preb cDNA probe showed expression of a 2.2-kb transcript in heart, brain, placenta, liver, skeletal muscle, kidney, and pancreas; a 1.9-kb transcript in brain, placenta, and lung; and a 1.5-kb transcript heart, skeletal muscle, and pancreas. By screening a fetal brain cDNA library with a rat Preb probe, followed by 5-prime primer walking, Taylor Clelland et al. (2000) isolated a cDNA encoding human PREB. The deduced 417-amino acid protein, which is 89% identical to the rat protein, has 3 conserved WD repeats and 2 conserved pro-gln-rich regions. RNA dot blot analysis detected variable expression of PREB in all adult and fetal tissues. They proposed that PREB is a DNA-binding factor during mammalian development and that abnormal dosage may play a role in some of the phenotypic abnormalities observed in the partial trisomy 2p syndrome, which is characterized by a number of congenital defects, including genital abnormalities.

[24516] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [24517] Fliss, M. S.; Hinkle, P. M.; Bancroft, C. : Expression cloning and characterization of PREB (prolactin regulatory element binding), a novel WD motif DNA-binding protein with a capacity to regulate prolactin promoter activity. *Molec. Endocr.* 13: 644–657, 1999. ; and
- [24518] Taylor Clelland, C. L.; Levy, B.; McKie, J. M.; Duncan, A. M. V.; Hirschhorn, K.; Bancroft, C. : Cloning and characterization of human PREB; a gene that maps to a genomic region associ.
- [24519] Further studies establishing the function and utilities of PREB are found in John Hopkins OMIM database record ID 606395, and in cited publications numbered 6795–6796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 24 (K0X 17) (ZNF24, Accession NM\_006965) is another VGAM565 host target gene. ZNF24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF24 BINDING SITE,

designated SEQ ID:13838, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24520] Another function of VGAM565 is therefore inhibition of Zinc Finger Protein 24 (KOX 17) (ZNF24, Accession NM\_006965). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF24. FLJ22028 (Accession NM\_024854) is another VGAM565 host target gene. FLJ22028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22028 BINDING SITE, designated SEQ ID:24286, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24521] Another function of VGAM565 is therefore inhibition of FLJ22028 (Accession NM\_024854). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22028. KIAA0626 (Accession NM\_021647) is another VGAM565

host target gene. KIAA0626 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0626 BINDING SITE, designated SEQ ID:22315, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24522] Another function of VGAM565 is therefore inhibition of KIAA0626 (Accession NM\_021647). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0626. KIAA0794 (Accession XM\_087353) is another VGAM565 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39184, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24523] Another function of VGAM565 is therefore inhibition of KIAA0794 (Accession XM\_087353). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. LOC157421 (Accession XM\_098756) is another VGAM565 host target gene. LOC157421 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157421 BINDING SITE, designated SEQ ID:41793, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24524] Another function of VGAM565 is therefore inhibition of LOC157421 (Accession XM\_098756). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157421. LOC257048 (Accession XM\_171240) is another VGAM565 host target gene. LOC257048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257048, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257048 BINDING SITE, designated SEQ ID:46027, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24525] Another function of VGAM565 is therefore inhibition of LOC257048 (Accession XM\_171240). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257048. LOC84549 (Accession NM\_032509) is another VGAM565 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26255, to the nucleotide sequence of VGAM565 RNA, herein designated VGAM RNA, also designated SEQ ID:3276.

[24526] Another function of VGAM565 is therefore inhibition of LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 566 (VGAM566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24527] VGAM566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM566 was detected is described hereinabove with reference to Figs. 1–8.

[24528] VGAM566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24529] VGAM566 gene encodes a VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM566 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM566 precursor RNA is designated SEQ ID:552, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:552 is located at position 101053 relative to the genome of Fowlpox Virus.

[24530] VGAM566 precursor RNA folds onto itself, forming VGAM566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM566 folded precursor RNA into VGAM566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM566 RNA is designated SEQ ID:3277, and is provided hereinbelow with reference to the sequence listing part.

[24532] VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM566 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24533] VGAM566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM566 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24534] The complementary binding of VGAM566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM566 host target RNA into VGAM566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24535] It is appreciated that VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM566 host target genes. The mRNA of each one of this plurality of VGAM566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM566 RNA, herein designated VGAM RNA, and which when bound by VGAM566 RNA causes in-

hibition of translation of respective one or more VGAM566 host target proteins.

[24536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM566 gene, herein designated VGAM GENE, on one or more VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24537] It is yet further appreciated that a function of VGAM566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM566 include diagnosis, prevention and

treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM566 correlate with, and may be deduced from, the identity of the host target genes which VGAM566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [24538] Nucleotide sequences of the VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM566 are further described hereinbelow with reference to Table 1.
- [24539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM566 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [24540] As mentioned hereinabove with reference to Fig. 1, a function of VGAM566 gene, herein designated VGAM is inhibition of expression of VGAM566 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM566 correlate with, and may be deduced from, the identity of the target genes which VGAM566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24541] Cytochrome P450, 51 (lanosterol 14- $\alpha$ -demethylase) (CYP51, Accession NM\_000786) is a VGAM566 host target gene. CYP51 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP51, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP51 BINDING SITE, designated SEQ ID:6435, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24542] A function of VGAM566 is therefore inhibition of Cytochrome P450, 51 (lanosterol 14- $\alpha$ -demethylase) (CYP51, Accession NM\_000786). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51. Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession

NM\_139125) is another VGAM566 host target gene.

MASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:29157, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24543] Another function of VGAM566 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM\_139125), a gene which a complement-dependent bactericidal factor. Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1. The function of MASP1 has been established by previous studies. The Ra-reactive factor (RARF) is a complement-dependent bactericidal factor that binds to the Ra and R2 polysaccharides expressed by certain enterobacteria. RARF activity is found in the sera of a diverse group of vertebrates, suggesting that it is an evolutionarily conserved mechanism

to resist infection by these bacterial strains. RARF includes a 100-kD component, CRARF, also called MASP1 or p100, that was thought to activate the complement components C4 (C4F, 120820; C4S, 120810), C2 (OMIM Ref. No. 217000), and C3 (OMIM Ref. No. 120700). Subsequent work, however, separated MASP1 from MASP2 (OMIM Ref. No. 605102) and showed that MASP1 activates C3 and C2, whereas MASP2 activates C4 and C2. The other component of RARF is mannan-binding lectin (OMIM Ref. No. 154545), a plasma protein member of the complement system that binds to microbial carbohydrates and activates the MASPs. The MASPs then recruit C4 and C2 to generate the C3 convertase or directly activate C3. Takada et al. (1993) cloned a partial human CRARF cDNA from a liver library. The human CRARF amino acid sequence is similar to the human complement subcomponents C1R (OMIM Ref. No. 216950) and C1S (OMIM Ref. No. 120580). Takada et al. (1995) obtained a corresponding mouse cDNA. By RT-PCR with primers based on N-terminal peptide sequence analysis and the consensus sequence of serine proteases, followed by screening a fetal liver cDNA library, Sato et al. (1994) isolated a cDNA encoding MASP. Sequence analysis predicted that the 699-amino acid pro-

tein contains a leader peptide; 2 structural domains similar to those of C1R and C1S; an EGF-like domain thought to be related to calcium-binding activity; 2 short consensus repeat domains; and a serine protease domain. Northern blot analysis revealed expression of 4.8- and 3.4-kb MASP transcripts in fetal liver; no expression was detected in adult tissues or in fetal heart, brain, lung, or kidney.

Sato et al. (1994) proposed that the MBL-MASP complex is a novel activator of complement in what they designated the lectin pathway. By biochemical purification of plasma proteins and immunoblot analysis, Dahl et al. (2001) detected a 42-kD serine protease associated with MBL. They identified a cDNA encoding this protein, MASP3, which is generated by alternative splicing of MASP1. The MASP3 transcription product is composed of an A chain, which is common to both MASP1 and MASP3, and a B chain, which is unique to MASP3. The deduced 728-amino acid MASP3 protein has a signal peptide, 3 N-glycosylation sites on the B chain and 4 on the A chain. Sato et al. (1994) mapped the MASP1 gene to 3q27-q28 by FISH. Using FISH, Takada et al. (1995) mapped the human CRARF gene to 3q27-q28 and the mouse gene to 16B2-B3, regions thought to share homology of synteny.

[24544] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24545] Dahl, M. R.; Thiel, S.; Matsushita, M.; Fujita, T.; Willis, A. C.; Christensen, T.; Vorup-Jensen, T.; Jensenius, J. C. : MASP-3 and its association with distinct complexes of the mannan-binding lectin complement activation pathway. *Immunity* 15: 127-135, 2001. ; and

[24546] Takada, F.; Seki, N.; Matsuda, Y.; Takayama, Y.; Kawakami, M. : Localization of the genes for the 100-kDa complement-activating components of Ra-reactive factor (CRARF and Crarf) to hum.

[24547] Further studies establishing the function and utilities of MASP1 are found in John Hopkins OMIM database record ID 600521, and in cited publications numbered 7504-7510 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, Lysine Deficient 3 (PRKWINK3, Accession XM\_029183) is another VGAM566 host target gene. PRKWINK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKWINK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PRKWNK3 BINDING SITE, designated SEQ ID:30854, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24548] Another function of VGAM566 is therefore inhibition of Protein Kinase, Lysine Deficient 3 (PRKWNK3, Accession XM\_029183). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK3. FLJ10199 (Accession XM\_048840) is another VGAM566 host target gene. FLJ10199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10199 BINDING SITE, designated SEQ ID:35284, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24549] Another function of VGAM566 is therefore inhibition of FLJ10199 (Accession XM\_048840). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10199. KIAA0981 (Accession XM\_028867) is another VGAM566 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:30794, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24550] Another function of VGAM566 is therefore inhibition of KIAA0981 (Accession XM\_028867). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. MGC4832 (Accession NM\_145061) is another VGAM566 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29697, to the nucleotide

sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24551] Another function of VGAM566 is therefore inhibition of MGC4832 (Accession NM\_145061). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4832. Ubiquitin-conjugating Enzyme E2D 1 (UBC4/5 homolog, yeast) (UBE2D1, Accession NM\_003338) is another VGAM566 host target gene. UBE2D1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2D1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2D1 BINDING SITE, designated SEQ ID:9345, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24552] Another function of VGAM566 is therefore inhibition of Ubiquitin-conjugating Enzyme E2D 1 (UBC4/5 homolog, yeast) (UBE2D1, Accession NM\_003338). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2D1. ZFP106 (Accession NM\_022473) is another

VGAM566 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22828, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24553] Another function of VGAM566 is therefore inhibition of ZFP106 (Accession NM\_022473). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC145739 (Accession XM\_085222) is another VGAM566 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37966, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24554] Another function of VGAM566 is therefore inhibition of LOC145739 (Accession XM\_085222). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. LOC147990 (Accession XM\_097358) is another VGAM566 host target gene. LOC147990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147990 BINDING SITE, designated SEQ ID:40862, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24555] Another function of VGAM566 is therefore inhibition of LOC147990 (Accession XM\_097358). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147990. LOC162239 (Accession XM\_091439) is another VGAM566 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40049, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24556] Another function of VGAM566 is therefore inhibition of LOC162239 (Accession XM\_091439). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. LOC221395 (Accession XM\_166354) is another VGAM566 host target gene. LOC221395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221395 BINDING SITE, designated SEQ ID:44182, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24557] Another function of VGAM566 is therefore inhibition of LOC221395 (Accession XM\_166354). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221395. LOC254778 (Accession XM\_171193) is another VGAM566 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45975, to the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, also designated SEQ ID:3277.

[24558] Another function of VGAM566 is therefore inhibition of LOC254778 (Accession XM\_171193). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. LOC51026 (Accession NM\_016072) is another VGAM566 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18139, to the nucleotide sequence of VGAM566 RNA, herein designated

VGAM RNA, also designated SEQ ID:3277.

[24559] Another function of VGAM566 is therefore inhibition of LOC51026 (Accession NM\_016072). Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 567 (VGAM567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24560] VGAM567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM567 was detected is described hereinabove with reference to Figs. 1–8.

[24561] VGAM567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24562] VGAM567 gene encodes a VGAM567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM567 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM567 precursor RNA is designated SEQ ID:553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:553 is located at position 126386 relative to the genome of Fowlpox Virus.

[24563] VGAM567 precursor RNA folds onto itself, forming VGAM567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24564] An enzyme complex designated DICER COMPLEX, `dices` the VGAM567 folded precursor RNA into VGAM567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM567 RNA is designated SEQ ID:3278, and is provided hereinbelow with reference to the sequence listing part.

[24565] VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM567 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24566] VGAM567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM567 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24567] The complementary binding of VGAM567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM567 host target RNA into VGAM567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24568] It is appreciated that VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM567 host target genes. The mRNA of

each one of this plurality of VGAM567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM567 RNA, herein designated VGAM RNA, and which when bound by VGAM567 RNA causes inhibition of translation of respective one or more VGAM567 host target proteins.

[24569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM567 gene, herein designated VGAM GENE, on one or more VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[24570] It is yet further appreciated that a function of VGAM567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM567 correlate with, and may be deduced from, the identity of the host target genes which VGAM567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24571] Nucleotide sequences of the VGAM567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM567 are further described hereinbelow with reference to Table 1.

[24572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM567 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM567 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[24573] As mentioned hereinabove with reference to Fig. 1, a function of VGAM567 gene, herein designated VGAM is inhibition of expression of VGAM567 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM567 correlate with, and may be deduced from, the identity of the target genes which VGAM567 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24574] ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM\_000702) is a VGAM567 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6372, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24575] A function of VGAM567 is therefore inhibition of ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Alpha 2 (+) Polypeptide (ATP1A2,

Accession NM\_000702). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_007331) is another VGAM567 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:14252, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24576] Another function of VGAM567 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_007331), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM200.Zinc Finger Protein 146 (ZNF146, Accession NM\_007145) is another VGAM567 host target gene. ZNF146 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF146 BINDING SITE, designated SEQ ID:13996, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24577] Another function of VGAM567 is therefore inhibition of Zinc Finger Protein 146 (ZNF146, Accession NM\_007145), a gene which binds zinc ions, DNA, and heparin. Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF146. The function of ZNF146 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192.ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656) is another VGAM567 host target gene. ARFD1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by ARFD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFD1 BINDING SITE, designated SEQ ID:7374, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24578] Another function of VGAM567 is therefore inhibition of ADP-ribosylation Factor Domain Protein 1, 64kDa (ARFD1, Accession NM\_001656). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFD1. BART1 (Accession NM\_012106) is another VGAM567 host target gene. BART1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BART1 BINDING SITE, designated SEQ ID:14426, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24579] Another function of VGAM567 is therefore inhibition of BART1 (Accession NM\_012106). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BART1. FLJ20093 (Accession NM\_017664) is another VGAM567 host target gene. FLJ20093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20093 BINDING SITE, designated SEQ ID:19206, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24580] Another function of VGAM567 is therefore inhibition of FLJ20093 (Accession NM\_017664). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20093. KIAA0763 (Accession NM\_014869) is another VGAM567 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16966, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24581] Another function of VGAM567 is therefore inhibition of KIAA0763 (Accession NM\_014869). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. Zinc Finger Protein 387 (ZNF387, Accession NM\_014682) is another VGAM567 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16181, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24582] Another function of VGAM567 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM\_014682). Accordingly, utilities of VGAM567 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ZNF387. LOC221830 (Accession XM\_166508) is another VGAM567 host target gene. LOC221830 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221830 BINDING SITE, designated SEQ ID:44437, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24583] Another function of VGAM567 is therefore inhibition of LOC221830 (Accession XM\_166508). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221830. LOC222493 (Accession XM\_169446) is another VGAM567 host target gene. LOC222493 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC222493 BINDING SITE, designated SEQ ID:45302, to the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, also designated SEQ ID:3278.

[24584] Another function of VGAM567 is therefore inhibition of LOC222493 (Accession XM\_169446). Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222493. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 568 (VGAM568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24585] VGAM568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM568 was detected is described hereinabove with reference to Figs. 1–8.

[24586] VGAM568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24587] VGAM568 gene encodes a VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM568 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM568 precursor RNA is designated SEQ ID:554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:554 is located at position 123346 relative to the genome of Fowlpox Virus.

[24588] VGAM568 precursor RNA folds onto itself, forming VGAM568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24589] An enzyme complex designated DICER COMPLEX, `dices` the VGAM568 folded precursor RNA into VGAM568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM568 RNA is designated SEQ ID:3279, and is provided hereinbelow with reference to the sequence listing part.

[24590] VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM568 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24591] VGAM568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM568 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24592] The complementary binding of VGAM568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM568 host target RNA into VGAM568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24593] It is appreciated that VGAM568 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM568 host target genes. The mRNA of each one of this plurality of VGAM568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM568 RNA, herein designated VGAM RNA, and which when bound by VGAM568 RNA causes inhibition of translation of respective one or more VGAM568 host target proteins.

[24594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM568 gene, herein designated VGAM GENE, on one or more VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[24595] It is yet further appreciated that a function of VGAM568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM568 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM568 correlate with, and may be deduced from, the identity of the host target genes which VGAM568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24596] Nucleotide sequences of the VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM568 are further described hereinbelow with reference to Table 1.

[24597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM568 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24598] As mentioned hereinabove with reference to Fig. 1, a function of VGAM568 gene, herein designated VGAM is inhibition of expression of VGAM568 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM568 correlate with, and may be deduced from, the identity of the target genes which VGAM568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24599] Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_000604) is a VGAM568 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6, designated SEQ ID:6210, SEQ ID:17981, SEQ ID:23363, SEQ ID:23367, SEQ

ID:23378 and SEQ ID:23375 respectively, to the nucleotide sequence of VGAM568 RNA, herein designated VGAM RNA, also designated SEQ ID:3279.

[24600] A function of VGAM568 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_000604). Accordingly, utilities of VGAM568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 569 (VGAM569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24601] VGAM569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM569 was detected is described hereinabove with reference to Figs. 1–8.

[24602] VGAM569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[24603] VGAM569 gene encodes a VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM569 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM569 precursor RNA is designated SEQ ID:555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:555 is located at position 127302 relative to the genome of Fowlpox Virus.

[24604] VGAM569 precursor RNA folds onto itself, forming VGAM569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24605] An enzyme complex designated DICER COMPLEX, `dices` the VGAM569 folded precursor RNA into VGAM569 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM569 RNA is designated SEQ ID:3280, and is provided hereinbelow with reference to the sequence listing part.

[24606] VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM569 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24607] VGAM569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM569 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24608] The complementary binding of VGAM569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM569 host target RNA into VGAM569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24609] It is appreciated that VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM569 host target genes. The mRNA of each one of this plurality of VGAM569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM569 RNA, herein designated VGAM RNA, and which when bound by VGAM569 RNA causes inhibition of translation of respective one or more VGAM569 host target proteins.

[24610] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM569 gene, herein designated VGAM GENE, on one or more VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24611] It is yet further appreciated that a function of VGAM569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM569 correlate with, and may be deduced from, the identity of the host target genes which VGAM569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24612] Nucleotide sequences of the VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM569 are further described hereinbelow with reference to Table 1.

[24613] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM569 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24614] As mentioned hereinabove with reference to Fig. 1, a function of VGAM569 gene, herein designated VGAM is inhibition of expression of VGAM569 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM569 correlate with, and may be deduced from, the identity of the target genes which VGAM569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24615] UDP-  
N-  
acetyl-al-  
pha-  
D-galac-  
tosamine:(N-acetylneuraminy)-galactosylglucosylceramid  
e N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT,  
Accession NM\_001478) is a VGAM569 host target gene.  
GALGT BINDING SITE is HOST TARGET binding site found  
in the 3' untranslated region of mRNA encoded by

GALGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALGT BINDING SITE, designated SEQ ID:7210, to the nucleotide sequence of VGAM569 RNA, herein designated VGAM RNA, also designated SEQ ID:3280.

[24616] A function of VGAM569 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM\_001478), a gene which is involved in the biosynthesis of gangliosides gm2, gd2 and ga2. Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.Homeo Box C10 (HOXC10, Accession XM\_028621) is another VGAM569

host target gene. HOXC10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXC10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC10 BINDING SITE, designated SEQ ID:30720, to the nucleotide sequence of VGAM569 RNA, herein designated VGAM RNA, also designated SEQ ID:3280.

[24617] Another function of VGAM569 is therefore inhibition of Homeo Box C10 (HOXC10, Accession XM\_028621). Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC10. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_003076) is another VGAM569 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1

and SMARCD1 BINDING SITE2, designated SEQ ID:9048 and SEQ ID:29146 respectively, to the nucleotide sequence of VGAM569 RNA, herein designated VGAM RNA, also designated SEQ ID:3280.

[24618] Another function of VGAM569 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_003076), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.LOC149628 (Accession XM\_086611) is another VGAM569 host target gene. LOC149628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149628 BINDING SITE, designated SEQ ID:38791, to the nucleotide sequence of

VGAM569 RNA, herein designated VGAM RNA, also designated SEQ ID:3280.

[24619] Another function of VGAM569 is therefore inhibition of LOC149628 (Accession XM\_086611). Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149628. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 570 (VGAM570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24620] VGAM570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM570 was detected is described hereinabove with reference to Figs. 1–8.

[24621] VGAM570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24622] VGAM570 gene encodes a VGAM570 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM570 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM570 precursor RNA is designated SEQ ID:556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:556 is located at position 124616 relative to the genome of Fowlpox Virus.

[24623] VGAM570 precursor RNA folds onto itself, forming VGAM570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24624] An enzyme complex designated DICER COMPLEX, `dices` the VGAM570 folded precursor RNA into VGAM570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM570 RNA is designated SEQ ID:3281, and is provided hereinbelow with reference to the sequence listing part.

[24625] VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM570 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24626] VGAM570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM570 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24627] The complementary binding of VGAM570 RNA, herein designated VGAM RNA, to host target binding sites on VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM570 host target RNA into VGAM570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24628] It is appreciated that VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM570 host target genes. The mRNA of each one of this plurality of VGAM570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM570 RNA, herein designated VGAM RNA, and which when bound by VGAM570 RNA causes inhibition of translation of respective one or more VGAM570 host target proteins.

[24629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM570 gene, herein designated VGAM GENE, on one or more VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[24630] It is yet further appreciated that a function of VGAM570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM570 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM570 correlate with, and may be deduced from, the identity of the host target genes which VGAM570 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[24631] Nucleotide sequences of the VGAM570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM570 are further described hereinbelow with reference to Table 1.

[24632] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM570 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24633] As mentioned hereinabove with reference to Fig. 1, a function of VGAM570 gene, herein designated VGAM is inhibition of expression of VGAM570 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM570 correlate with, and may be deduced from, the identity of the target genes which VGAM570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24634] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM\_003783) is a VGAM570 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9871, to the nucleotide sequence of VGAM570 RNA, herein designated VGAM RNA, also designated SEQ ID:3281.

[24635] A function of VGAM570 is therefore inhibition of UDP-

Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM\_003783). Accordingly, utilities of VGAM570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 571 (VGAM571) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24636] VGAM571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM571 was detected is described hereinabove with reference to Figs. 1-8.

[24637] VGAM571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24638] VGAM571 gene encodes a VGAM571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM571

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM571 precursor RNA is designated SEQ ID:557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:557 is located at position 152048 relative to the genome of Fowlpox Virus.

[24639] VGAM571 precursor RNA folds onto itself, forming VGAM571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24640] An enzyme complex designated DICER COMPLEX, `dices` the VGAM571 folded precursor RNA into VGAM571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM571 RNA is designated SEQ ID:3282, and is provided hereinbelow with reference to the sequence listing part.

[24641] VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM571 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24642] VGAM571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM571 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24643] The complementary binding of VGAM571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM571 host target RNA into VGAM571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24644] It is appreciated that VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM571 host target genes. The mRNA of each one of this plurality of VGAM571 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM571 RNA, herein designated VGAM RNA, and which when bound by VGAM571 RNA causes inhibition of translation of respective one or more VGAM571 host target proteins.

[24645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM571 gene, herein designated VGAM GENE, on one or more VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24646] It is yet further appreciated that a function of VGAM571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM571 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM571 correlate with, and may be deduced from, the identity of the host target genes which VGAM571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24647] Nucleotide sequences of the VGAM571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM571 are further described hereinbelow with reference to Table 1.

[24648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM571 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM571 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[24649] As mentioned hereinabove with reference to Fig. 1, a function of VGAM571 gene, herein designated VGAM is inhibition of expression of VGAM571 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM571 correlate with, and may be deduced from, the identity of the target genes which VGAM571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24650] FLJ12448 (Accession NM\_022895) is a VGAM571 host target gene. FLJ12448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12448 BINDING SITE, designated SEQ ID:23156, to the nucleotide sequence of VGAM571 RNA, herein designated VGAM RNA, also designated SEQ ID:3282.

[24651] A function of VGAM571 is therefore inhibition of FLJ12448 (Accession NM\_022895). Accordingly, utilities of VGAM571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12448.

KIAA0293 (Accession XM\_027045) is another VGAM571 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30393, to the nucleotide sequence of VGAM571 RNA, herein designated VGAM RNA, also designated SEQ ID:3282.

[24652] Another function of VGAM571 is therefore inhibition of KIAA0293 (Accession XM\_027045). Accordingly, utilities of VGAM571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. LOC152245 (Accession XM\_098182) is another VGAM571 host target gene. LOC152245 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152245 BINDING SITE, designated SEQ ID:41448, to the nucleotide sequence of VGAM571 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3282.

[24653] Another function of VGAM571 is therefore inhibition of LOC152245 (Accession XM\_098182). Accordingly, utilities of VGAM571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 572 (VGAM572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24654] VGAM572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM572 was detected is described hereinabove with reference to Figs. 1–8.

[24655] VGAM572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24656] VGAM572 gene encodes a VGAM572 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM572 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM572 precursor RNA is designated SEQ ID:558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:558 is located at position 151611 relative to the genome of Fowlpox Virus.

[24657] VGAM572 precursor RNA folds onto itself, forming VGAM572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24658] An enzyme complex designated DICER COMPLEX, `dices` the VGAM572 folded precursor RNA into VGAM572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM572 RNA is designated SEQ ID:3283, and is provided hereinbelow with reference to the sequence listing part.

[24659] VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM572 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24660] VGAM572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM572 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24661] The complementary binding of VGAM572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM572 host target RNA into VGAM572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24662] It is appreciated that VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM572 host target genes. The mRNA of

each one of this plurality of VGAM572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM572 RNA, herein designated VGAM RNA, and which when bound by VGAM572 RNA causes inhibition of translation of respective one or more VGAM572 host target proteins.

[24663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM572 gene, herein designated VGAM GENE, on one or more VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[24664] It is yet further appreciated that a function of VGAM572 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM572 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM572 correlate with, and may be deduced from, the identity of the host target genes which VGAM572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24665] Nucleotide sequences of the VGAM572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM572 are further described hereinbelow with reference to Table 1.

[24666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM572 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM572 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[24667] As mentioned hereinabove with reference to Fig. 1, a function of VGAM572 gene, herein designated VGAM is inhibition of expression of VGAM572 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM572 correlate with, and may be deduced from, the identity of the target genes which VGAM572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24668] KIAA1948 (Accession XM\_091984) is a VGAM572 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40078, to the nucleotide sequence of VGAM572 RNA, herein designated VGAM RNA, also designated SEQ ID:3283.

[24669] A function of VGAM572 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM572 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1948. RASD Family, Member 2 (RASD2, Accession NM\_014310) is another VGAM572 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15599, to the nucleotide sequence of VGAM572 RNA, herein designated VGAM RNA, also designated SEQ ID:3283.

[24670] Another function of VGAM572 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 573 (VGAM573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24671] VGAM573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM573 was detected is described hereinabove with reference to Figs. 1–8.

[24672] VGAM573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24673] VGAM573 gene encodes a VGAM573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM573 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM573 precursor RNA is designated SEQ ID:559, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:559 is located at position 150116 relative to the genome of Fowlpox Virus.

[24674] VGAM573 precursor RNA folds onto itself, forming VGAM573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[24675] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM573 folded precursor RNA into VGAM573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM573 RNA is designated SEQ ID:3284, and is provided hereinbelow with reference to the sequence listing part.

[24676] VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM573 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[24677] VGAM573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM573 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24678] The complementary binding of VGAM573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM573 host target RNA into VGAM573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24679] It is appreciated that VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM573 host target genes. The mRNA of each one of this plurality of VGAM573 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM573 RNA, herein designated VGAM RNA, and which when bound by VGAM573 RNA causes inhibition of translation of respective one or more VGAM573 host target proteins.

[24680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM573 gene, herein designated VGAM GENE, on one or more VGAM573 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24681] It is yet further appreciated that a function of VGAM573 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM573 correlate with, and may be deduced from, the identity of the host target genes which VGAM573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24682] Nucleotide sequences of the VGAM573 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM573 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM573 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM573 are further  
described hereinbelow with reference to Table 1.

[24683] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM573 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM573 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[24684] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM573 gene, herein designated VGAM is  
inhibition of expression of VGAM573 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM573 correlate with, and may be deduced  
from, the identity of the target genes which VGAM573  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[24685] Zinc Finger Protein 268 (ZNF268, Accession XM\_031851)  
is a VGAM573 host target gene. ZNF268 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF268 BINDING SITE, designated SEQ ID:31498, to the nucleotide sequence of VGAM573 RNA, herein designated VGAM RNA, also designated SEQ ID:3284.

[24686] A function of VGAM573 is therefore inhibition of Zinc Finger Protein 268 (ZNF268, Accession XM\_031851). Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF268. KIAA0970 (Accession NM\_014923) is another VGAM573 host target gene. KIAA0970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0970 BINDING SITE, designated SEQ ID:17203, to the nucleotide sequence of VGAM573 RNA, herein designated VGAM RNA, also designated SEQ ID:3284.

[24687] Another function of VGAM573 is therefore inhibition of

KIAA0970 (Accession NM\_014923). Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0970. TBC1 Domain Family, Member 2 (TBC1D2, Accession NM\_018421) is another VGAM573 host target gene. TBC1D2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TBC1D2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBC1D2 BINDING SITE, designated SEQ ID:20467, to the nucleotide sequence of VGAM573 RNA, herein designated VGAM RNA, also designated SEQ ID:3284.

[24688] Another function of VGAM573 is therefore inhibition of TBC1 Domain Family, Member 2 (TBC1D2, Accession NM\_018421). Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBC1D2. LOC92283 (Accession XM\_044049) is another VGAM573 host target gene. LOC92283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92283, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92283 BINDING SITE, designated SEQ ID:34092, to the nucleotide sequence of VGAM573 RNA, herein designated VGAM RNA, also designated SEQ ID:3284.

[24689] Another function of VGAM573 is therefore inhibition of LOC92283 (Accession XM\_044049). Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 574 (VGAM574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24690] VGAM574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM574 was detected is described hereinabove with reference to Figs. 1–8.

[24691] VGAM574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24692] VGAM574 gene encodes a VGAM574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM574 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM574 precursor RNA is designated SEQ ID:560, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:560 is located at position 151276 relative to the genome of Fowlpox Virus.

[24693] VGAM574 precursor RNA folds onto itself, forming VGAM574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24694] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM574 folded precursor RNA into VGAM574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM574 RNA is designated SEQ ID:3285, and is provided hereinbelow with reference to the sequence listing part.

[24695] VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM574 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24696] VGAM574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM574 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24697] The complementary binding of VGAM574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM574 host target RNA into VGAM574 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24698] It is appreciated that VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM574 host target genes. The mRNA of each one of this plurality of VGAM574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM574 RNA, herein designated VGAM RNA, and which when bound by VGAM574 RNA causes inhibition of translation of respective one or more VGAM574 host target proteins.

[24699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM574 gene, herein designated VGAM GENE, on one or more VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24700] It is yet further appreciated that a function of VGAM574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM574 correlate with, and may be deduced from, the identity of the host target genes which VGAM574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24701] Nucleotide sequences of the VGAM574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM574 are further described hereinbelow with reference to Table 1.

[24702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM574 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM574 gene, herein designated VGAM is inhibition of expression of VGAM574 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM574 correlate with, and may be deduced from, the identity of the target genes which VGAM574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24704] Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493) is a VGAM574 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13225, to the nucleotide

sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24705] A function of VGAM574 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. FLJ13646 (Accession NM\_024584) is another VGAM574 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23810, to the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24706] Another function of VGAM574 is therefore inhibition of FLJ13646 (Accession NM\_024584). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13646. KIAA1615 (Accession XM\_044021) is another VGAM574 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34081, to the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24707] Another function of VGAM574 is therefore inhibition of KIAA1615 (Accession XM\_044021). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435) is another VGAM574 host target gene. SLC21A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A14 BINDING SITE, designated SEQ ID:18891, to the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24708] Another function of VGAM574 is therefore inhibition of

Solute Carrier Family 21 (organic anion transporter), Member 14 (SLC21A14, Accession NM\_017435). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A14. LOC146229 (Accession XM\_085387) is another VGAM574 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38115, to the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24709] Another function of VGAM574 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC92405 (Accession XM\_044914) is another VGAM574 host target gene. LOC92405 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92405, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92405 BINDING SITE, designated SEQ ID:34303, to the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, also designated SEQ ID:3285.

[24710] Another function of VGAM574 is therefore inhibition of LOC92405 (Accession XM\_044914). Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92405. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 575 (VGAM575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24711] VGAM575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM575 was detected is described hereinabove with reference to Figs. 1–8.

[24712] VGAM575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM575 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[24713] VGAM575 gene encodes a VGAM575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM575 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM575 precursor RNA is designated SEQ ID:561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:561 is located at position 159770 relative to the genome of Fowlpox Virus.

[24714] VGAM575 precursor RNA folds onto itself, forming VGAM575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24715] An enzyme complex designated DICER COMPLEX, `dices` the VGAM575 folded precursor RNA into VGAM575 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM575 RNA is designated SEQ ID:3286, and is provided hereinbelow with reference to the sequence listing part.

[24716] VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM575 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24717] VGAM575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM575 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24718] The complementary binding of VGAM575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM575 host target RNA into VGAM575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[24719] It is appreciated that VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM575 host target genes. The mRNA of each one of this plurality of VGAM575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM575 RNA, herein designated VGAM RNA, and which when bound by VGAM575 RNA causes inhibition of translation of respective one or more VGAM575 host target proteins.

[24720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM575 gene, herein designated VGAM GENE, on one or more VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24721] It is yet further appreciated that a function of VGAM575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM575 correlate with, and may be deduced from, the identity of the host target genes which VGAM575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24722] Nucleotide sequences of the VGAM575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM575 are further described hereinbelow with reference to Table 1.

[24723] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM575 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM575 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24724] As mentioned hereinabove with reference to Fig. 1, a function of VGAM575 gene, herein designated VGAM is inhibition of expression of VGAM575 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM575 correlate with, and may be deduced from, the identity of the target genes which VGAM575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24725] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is a VGAM575 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15422, to the nucleotide sequence of VGAM575 RNA,

herein designated VGAM RNA, also designated SEQ ID:3286.

[24726] A function of VGAM575 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is another VGAM575 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42723, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24727] Another function of VGAM575 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A.

The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Hematopoietically Expressed Homeobox (HHEX, Accession NM\_002729) is another VGAM575 host target gene. HHEX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HHEX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHEX BINDING SITE, designated SEQ ID:8595, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24728] Another function of VGAM575 is therefore inhibition of Hematopoietically Expressed Homeobox (HHEX, Accession NM\_002729), a gene which may play a role in hematopoietic differentiation. Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHEX. The function of HHEX has been established by previous studies. Tanaka et al. (1999) found that rat HHEX functions as a transcriptional repressor in liver cells and may be involved in the

differentiation and/or maintenance of the differentiated state in hepatocytes. The divergent homeobox gene HEX is expressed in the anterior visceral endoderm during early mouse development and in some adult tissues of endodermal origin, including liver and thyroid. D'Elia et al. (2002) analyzed HEX expression and subcellular localization in a series of 55 human thyroid tumors and in several tumor cell lines. HEX mRNA was detected by RT-PCR either in normal tissues or in thyroid adenomas and differentiated (papillary and follicular) carcinomas. HEX mRNA was also expressed in most undifferentiated carcinomas. In normal tissues and adenomas, HEX protein was present both in nucleus and cytoplasm. In contrast, both differentiated and undifferentiated carcinomas, as well as the tumor cell lines investigated, showed HEX protein only in the cytoplasm. These findings suggested that regulation of HEX entry in the nucleus of thyrocytes may represent a critical step during human thyroid tumorigenesis.

[24729] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24730] Tanaka, T.; Inazu, T.; Yamada, K.; Myint, Z.; Keng, V. W; Inoue, Y.; Taniguchi, N.; Noguchi, T. : cDNA cloning and

expression of rat homeobox gene, Hex, and functional characterization of the protein. Biochem. J. 339: 111–117, 1999. ; and

[24731] D'Elia, A. V.; Tell, G.; Russo, D.; Arturi, F.; Puglisi, F.; Manfioletti, G.; Gattei, V.; Mack, D. L.; Cataldi, P.; Filetti, S.; Di Loreto, C.; Damante, G. : Expression and localization.

[24732] Further studies establishing the function and utilities of HHEX are found in John Hopkins OMIM database record ID 604420, and in cited publications numbered 7397–7402 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp547H025 (Accession NM\_020161) is another VGAM575 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21372, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24733] Another function of VGAM575 is therefore inhibition of DKFZp547H025 (Accession NM\_020161). Accordingly,

utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. DKFZp761B0514 (Accession NM\_032289) is another VGAM575 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26050, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24734] Another function of VGAM575 is therefore inhibition of DKFZp761B0514 (Accession NM\_032289). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. Eukaryotic Translation Initiation Factor 2, Subunit 1 Alpha, 35kDa (EIF2S1, Accession NM\_004094) is another VGAM575 host target gene. EIF2S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2S1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2S1 BINDING SITE, designated SEQ ID:10299, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24735] Another function of VGAM575 is therefore inhibition of Eukaryotic Translation Initiation Factor 2, Subunit 1 Alpha, 35kDa (EIF2S1, Accession NM\_004094). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S1. KIAA0008 (Accession NM\_014750) is another VGAM575 host target gene. KIAA0008 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0008 BINDING SITE, designated SEQ ID:16461, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24736] Another function of VGAM575 is therefore inhibition of KIAA0008 (Accession NM\_014750). Accordingly, utilities

of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0008. KIAA1673 (Accession XM\_047672) is another VGAM575 host target gene. KIAA1673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1673 BINDING SITE, designated SEQ ID:35026, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24737] Another function of VGAM575 is therefore inhibition of KIAA1673 (Accession XM\_047672). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1673. KIAA1911 (Accession XM\_056302) is another VGAM575 host target gene. KIAA1911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1911 BINDING SITE, designated SEQ ID:36392, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24738] Another function of VGAM575 is therefore inhibition of KIAA1911 (Accession XM\_056302). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1911. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107) is another VGAM575 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13974, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24739] Another function of VGAM575 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SSR3. LOC147341 (Accession XM\_097223) is another VGAM575 host target gene. LOC147341 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147341 BINDING SITE, designated SEQ ID:40829, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24740] Another function of VGAM575 is therefore inhibition of LOC147341 (Accession XM\_097223). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147341. LOC148195 (Accession XM\_097419) is another VGAM575 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40875, to the nucleotide sequence of VGAM575 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3286.

[24741] Another function of VGAM575 is therefore inhibition of LOC148195 (Accession XM\_097419). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC158819 (Accession XM\_098995) is another VGAM575 host target gene. LOC158819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158819 BINDING SITE, designated SEQ ID:42028, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24742] Another function of VGAM575 is therefore inhibition of LOC158819 (Accession XM\_098995). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158819. LOC51026 (Accession NM\_016072) is another VGAM575 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51026, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18141, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24743] Another function of VGAM575 is therefore inhibition of LOC51026 (Accession NM\_016072). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. LOC91035 (Accession XM\_035622) is another VGAM575 host target gene. LOC91035 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91035 BINDING SITE, designated SEQ ID:32291, to the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, also designated SEQ ID:3286.

[24744] Another function of VGAM575 is therefore inhibition of LOC91035 (Accession XM\_035622). Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91035. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 576 (VGAM576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24745] VGAM576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM576 was detected is described hereinabove with reference to Figs. 1–8.

[24746] VGAM576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24747] VGAM576 gene encodes a VGAM576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM576 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM576 precursor RNA is designated SEQ

ID:562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:562 is located at position 160178 relative to the genome of Fowlpox Virus.

[24748] VGAM576 precursor RNA folds onto itself, forming VGAM576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM576 folded precursor RNA into VGAM576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM576 RNA is designated SEQ ID:3287, and is provided hereinbelow with reference to the sequence

listing part.

[24750] VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM576 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24751] VGAM576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM576 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM576 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24752] The complementary binding of VGAM576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM576 host target RNA into VGAM576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24753] It is appreciated that VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM576 host target genes. The mRNA of each one of this plurality of VGAM576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM576 RNA, herein designated VGAM

RNA, and which when bound by VGAM576 RNA causes inhibition of translation of respective one or more VGAM576 host target proteins.

[24754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM576 gene, herein designated VGAM GENE, on one or more VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24755] It is yet further appreciated that a function of VGAM576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM576 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM576 correlate with, and may be deduced from, the identity of the host target genes which VGAM576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24756] Nucleotide sequences of the VGAM576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM576 are further described hereinbelow with reference to Table 1.

[24757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM576 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM576 gene, herein designated VGAM is

inhibition of expression of VGAM576 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM576 correlate with, and may be deduced from, the identity of the target genes which VGAM576 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24759] Sorbitol Dehydrogenase (SORD, Accession NM\_003104) is a VGAM576 host target gene. SORD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORD BINDING SITE, designated SEQ ID:9069, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24760] A function of VGAM576 is therefore inhibition of Sorbitol Dehydrogenase (SORD, Accession NM\_003104). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORD. Wilms Tumor 1 (WT1, Accession NM\_024424) is another VGAM576 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23666, SEQ ID:5950, SEQ ID:23670 and SEQ ID:23674 respectively, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24761] Another function of VGAM576 is therefore inhibition of Wilms Tumor 1 (WT1, Accession NM\_024424). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. FLJ11011 (Accession NM\_018299) is another VGAM576 host target gene. FLJ11011 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11011 BINDING SITE, designated SEQ ID:20290, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM

RNA, also designated SEQ ID:3287.

[24762] Another function of VGAM576 is therefore inhibition of FLJ11011 (Accession NM\_018299). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11011. FLJ20802 (Accession NM\_017959) is another VGAM576 host target gene. FLJ20802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20802 BINDING SITE, designated SEQ ID:19673, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24763] Another function of VGAM576 is therefore inhibition of FLJ20802 (Accession NM\_017959). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20802. KIAA1396 (Accession XM\_032054) is another VGAM576 host target gene. KIAA1396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1396, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1396 BINDING SITE, designated SEQ ID:31547, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24764] Another function of VGAM576 is therefore inhibition of KIAA1396 (Accession XM\_032054). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1396. LOC116166 (Accession XM\_007651) is another VGAM576 host target gene. LOC116166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116166 BINDING SITE, designated SEQ ID:30059, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24765] Another function of VGAM576 is therefore inhibition of LOC116166 (Accession XM\_007651). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC116166. LOC201696 (Accession XM\_032269) is another VGAM576 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31624, to the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24766] Another function of VGAM576 is therefore inhibition of LOC201696 (Accession XM\_032269). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC254266 (Accession XM\_173221) is another VGAM576 host target gene. LOC254266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254266 BINDING SITE, designated SEQ ID:46479, to

the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, also designated SEQ ID:3287.

[24767] Another function of VGAM576 is therefore inhibition of LOC254266 (Accession XM\_173221). Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 577 (VGAM577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24768] VGAM577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM577 was detected is described hereinabove with reference to Figs. 1–8.

[24769] VGAM577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24770] VGAM577 gene encodes a VGAM577 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM577 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM577 precursor RNA is designated SEQ ID:563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:563 is located at position 170504 relative to the genome of Fowlpox Virus.

[24771] VGAM577 precursor RNA folds onto itself, forming VGAM577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24772] An enzyme complex designated DICER COMPLEX, `dices` the VGAM577 folded precursor RNA into VGAM577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM577 RNA is designated SEQ ID:3288, and is provided hereinbelow with reference to the sequence listing part.

[24773] VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM577 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[24774] VGAM577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM577 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24775] The complementary binding of VGAM577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM577 host target RNA into VGAM577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24776] It is appreciated that VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM577 host target genes. The mRNA of each one of this plurality of VGAM577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM577 RNA, herein designated VGAM RNA, and which when bound by VGAM577 RNA causes inhibition of translation of respective one or more VGAM577 host target proteins.

[24777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM577 gene, herein designated VGAM GENE, on one or more VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[24778] It is yet further appreciated that a function of VGAM577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM577 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM577 correlate with, and may be deduced from, the identity of the host target genes which VGAM577 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[24779] Nucleotide sequences of the VGAM577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM577 are further described hereinbelow with reference to Table 1.

[24780] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM577 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24781] As mentioned hereinabove with reference to Fig. 1, a function of VGAM577 gene, herein designated VGAM is inhibition of expression of VGAM577 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM577 correlate with, and may be deduced from, the identity of the target genes which VGAM577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24782] TOX (Accession NM\_014729) is a VGAM577 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:16325, to the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, also designated SEQ ID:3288.

[24783] A function of VGAM577 is therefore inhibition of TOX (Accession NM\_014729). Accordingly, utilities of VGAM577 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TOX.

Ubiquitin-like 3 (UBL3, Accession NM\_007106) is another VGAM577 host target gene. UBL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBL3 BINDING SITE, designated SEQ ID:13965, to the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, also designated SEQ ID:3288.

[24784] Another function of VGAM577 is therefore inhibition of Ubiquitin-like 3 (UBL3, Accession NM\_007106), a gene which appears to have a diverse range of cellular functions. Accordingly, utilities of VGAM577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL3. The function of UBL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.DKFZP547E2110 (Accession XM\_165676) is another VGAM577 host target gene. DKFZP547E2110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by DKFZP547E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E2110 BINDING SITE, designated SEQ ID:43731, to the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, also designated SEQ ID:3288.

[24785] Another function of VGAM577 is therefore inhibition of DKFZP547E2110 (Accession XM\_165676). Accordingly, utilities of VGAM577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E2110. FLJ10352 (Accession NM\_032142) is another VGAM577 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25828, to the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, also designated SEQ ID:3288.

[24786] Another function of VGAM577 is therefore inhibition of FLJ10352 (Accession NM\_032142). Accordingly, utilities of

VGAM577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. KIAA1028 (Accession XM\_166324) is another VGAM577 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44166, to the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, also designated SEQ ID:3288.

[24787] Another function of VGAM577 is therefore inhibition of KIAA1028 (Accession XM\_166324). Accordingly, utilities of VGAM577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 578 (VGAM578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24788] VGAM578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM578 was detected is described hereinabove with reference to Figs. 1–8.

[24789] VGAM578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24790] VGAM578 gene encodes a VGAM578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM578 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM578 precursor RNA is designated SEQ ID:564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:564 is located at position 168962 relative to the genome of Fowlpox Virus.

[24791] VGAM578 precursor RNA folds onto itself, forming VGAM578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24792] An enzyme complex designated DICER COMPLEX, `dices` the VGAM578 folded precursor RNA into VGAM578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM578 RNA is designated SEQ ID:3289, and is provided hereinbelow with reference to the sequence listing part.

[24793] VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM578 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[24794] VGAM578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM578 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM578 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24795] The complementary binding of VGAM578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM578 host target RNA into VGAM578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24796] It is appreciated that VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM578 host target genes. The mRNA of each one of this plurality of VGAM578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM578 RNA, herein designated VGAM RNA, and which when bound by VGAM578 RNA causes inhibition of translation of respective one or more VGAM578 host target proteins.

[24797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM578 gene, herein designated VGAM GENE, on one or more VGAM578 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24798] It is yet further appreciated that a function of VGAM578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM578 correlate with, and may be deduced from, the identity of the host target genes which VGAM578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24799] Nucleotide sequences of the VGAM578 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM578 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM578 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM578 are further  
described hereinbelow with reference to Table 1.

[24800] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM578 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM578 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[24801] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM578 gene, herein designated VGAM is  
inhibition of expression of VGAM578 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM578 correlate with, and may be deduced  
from, the identity of the target genes which VGAM578  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[24802] Calcium/calmodulin-dependent Protein Kinase IV (CAMK4,  
Accession NM\_001744) is a VGAM578 host target gene.

CAMK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMK4 BINDING SITE, designated SEQ ID:7482, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24803] A function of VGAM578 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase IV (CAMK4, Accession NM\_001744), a gene which is a heat-stable, acidic, calmodulin-binding protein. Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMK4. The function of CAMK4 has been established by previous studies. Protein phosphorylation, a prominent activity in the brain, apparently plays an important role in several neural functions such as neural transmitter release, ion channel modulation, and axoplasmic transport. Sikela et al. (1989) identified cDNA clones corresponding to a brain Ca(2+)/calmodulin-dependent protein kinase, which they referred to as brain CaM kinase IV (CAMK4). On the basis

of Western blot analysis, this kinase appeared to be restricted to brain in the rat; interestingly, it was not detected in the brain of the newborn, but became detectable within a few days after birth. Animal model experiments lend further support to the function of CAMK4. Camk4 is a multifunctional serine/threonine protein kinase with limited tissue distribution that has been implicated in transcriptional regulation in lymphocytes, neurons, and male germ cells. In the mouse testis, however, Camk4 is expressed in spermatids and associated with chromatin and nuclear matrix. Elongating spermatids are not transcriptionally active, raising the possibility that Camk4 has a novel function in male germ cells. To investigate the role of Camk4 in spermatogenesis, Wu et al. (2000) generated mice with a targeted deletion of the Camk4 gene. Male Camk4  $-/-$  mice were infertile with impairment of spermiogenesis in late elongating spermatids. The sequential deposition of sperm basic nuclear proteins on chromatin was disrupted, with a specific loss of protamine-2 (OMIM Ref. No. 182890) and prolonged retention of transition protein-2 (OMIM Ref. No. 190232) in step-15 spermatids. Protamine-2 is phosphorylated by Camk4 in vitro, implicating a connection between Camk4

signaling and the exchange of basic nuclear proteins in mammalian male germ cells. Defects in protamine-2 have been identified in sperm of infertile men, suggesting that the results of Wu et al. (2000) may have clinical implications for the understanding of human male infertility.

[24804] It is appreciated that the abovementioned animal model for CAMK4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[24805] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24806] Sikela, J. M.; Law, M. L.; Kao, F.-T.; Hartz, J. A.; Wei, Q.; Hahn, W. E. : Chromosomal localization of the human gene for brain Ca(2+)/calmodulin-dependent protein kinase type IV. *Genomics* 4: 21-27, 1989. ; and

[24807] Wu, J. Y.; Ribar, T. J.; Cummings, D. E.; Burton, K. A.; McKnight, G. S.; Means, A. R. : Spermiogenesis and exchange of basic nuclear proteins are impaired in male germ cells lacking Cam.

[24808] Further studies establishing the function and utilities of CAMK4 are found in John Hopkins OMIM database record ID 114080, and in cited publications numbered

12075–12081 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Down Syndrome Critical Region Gene 1–like 1 (DSCR1L1, Accession NM\_005822) is another VGAM578 host target gene. DSCR1L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSCR1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1L1 BINDING SITE, designated SEQ ID:12431, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24809] Another function of VGAM578 is therefore inhibition of Down Syndrome Critical Region Gene 1–like 1 (DSCR1L1, Accession NM\_005822). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1L1.

FLJ13646 (Accession NM\_024584) is another VGAM578 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23814, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24810] Another function of VGAM578 is therefore inhibition of FLJ13646 (Accession NM\_024584). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13646. FLJ14106 (Accession NM\_025067) is another VGAM578 host target gene. FLJ14106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14106 BINDING SITE, designated SEQ ID:24663, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24811] Another function of VGAM578 is therefore inhibition of FLJ14106 (Accession NM\_025067). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14106.

KIAA0515 (Accession XM\_033380) is another VGAM578 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31928, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24812] Another function of VGAM578 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA1554 (Accession XM\_170834) is another VGAM578 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45612, to the nucleotide sequence of VGAM578 RNA, herein designated

VGAM RNA, also designated SEQ ID:3289.

[24813] Another function of VGAM578 is therefore inhibition of KIAA1554 (Accession XM\_170834). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM\_003932) is another VGAM578 host target gene. ST13 BINDING SITE1 and ST13 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST13 BINDING SITE1 and ST13 BINDING SITE2, designated SEQ ID:10032 and SEQ ID:10033 respectively, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24814] Another function of VGAM578 is therefore inhibition of Suppression of Tumorigenicity 13 (colon carcinoma) (Hsp70 interacting protein) (ST13, Accession NM\_003932). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ST13. LOC157798 (Accession XM\_098827) is another VGAM578 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41851, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24815] Another function of VGAM578 is therefore inhibition of LOC157798 (Accession XM\_098827). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC163590 (Accession NM\_145034) is another VGAM578 host target gene. LOC163590 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163590 BINDING SITE, designated SEQ ID:29652, to the nucleotide sequence of VGAM578 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3289.

[24816] Another function of VGAM578 is therefore inhibition of LOC163590 (Accession NM\_145034). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163590. LOC255045 (Accession XM\_171243) is another VGAM578 host target gene. LOC255045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46034, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24817] Another function of VGAM578 is therefore inhibition of LOC255045 (Accession XM\_171243). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. LOC51134 (Accession NM\_016122) is another VGAM578 host target gene. LOC51134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51134, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51134 BINDING SITE, designated SEQ ID:18207, to the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, also designated SEQ ID:3289.

[24818] Another function of VGAM578 is therefore inhibition of LOC51134 (Accession NM\_016122). Accordingly, utilities of VGAM578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 579 (VGAM579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24819] VGAM579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM579 was detected is described hereinabove with reference to Figs. 1–8.

[24820] VGAM579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24821] VGAM579 gene encodes a VGAM579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM579 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM579 precursor RNA is designated SEQ ID:565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:565 is located at position 219679 relative to the genome of Fowlpox Virus.

[24822] VGAM579 precursor RNA folds onto itself, forming VGAM579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24823] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM579 folded precursor RNA into VGAM579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM579 RNA is designated SEQ ID:3290, and is provided hereinbelow with reference to the sequence listing part.

[24824] VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM579 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24825] VGAM579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM579 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM579 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24826] The complementary binding of VGAM579 RNA, herein designated VGAM RNA, to host target binding sites on VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM579 host target RNA into VGAM579 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24827] It is appreciated that VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM579 host target genes. The mRNA of each one of this plurality of VGAM579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM579 RNA, herein designated VGAM RNA, and which when bound by VGAM579 RNA causes inhibition of translation of respective one or more VGAM579 host target proteins.

[24828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM579 gene, herein designated VGAM GENE, on one or more VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24829] It is yet further appreciated that a function of VGAM579 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM579 correlate with, and may be deduced from, the identity of the host target genes which VGAM579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24830] Nucleotide sequences of the VGAM579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM579 are further described hereinbelow with reference to Table 1.

[24831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM579 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24832] As mentioned hereinabove with reference to Fig. 1, a function of VGAM579 gene, herein designated VGAM is inhibition of expression of VGAM579 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM579 correlate with, and may be deduced from, the identity of the target genes which VGAM579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24833] Adducin 3 (gamma) (ADD3, Accession NM\_016824) is a VGAM579 host target gene. ADD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD3 BINDING SITE, designated SEQ ID:18818, to the nucleotide sequence of

VGAM579 RNA, herein designated VGAM RNA, also designated SEQ ID:3290.

[24834] A function of VGAM579 is therefore inhibition of Adducin 3 (gamma) (ADD3, Accession NM\_016824), a gene which membrane-cytoskeleton-associated protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD3. The function of ADD3 has been established by previous studies. From a human fetal-brain cDNA library, Katagiri et al. (1996) isolated a novel human cDNA which they termed adducin-like 70. The predicted amino acid sequence shows a high degree of homology to adducins (alpha- 102680; beta- 102681). In human erythrocytes, adducin is a 200-kD heterodimeric skeletal component of the cell membrane, where it promotes the binding of spectrin to actin. This binding is regulated by calcium/calmodulin (OMIM Ref. No. 114180). Adducin also is phosphorylated by protein kinase-C. Adducin and its multiple isoforms represent a family of proteins present in a variety of tissues and cultured cell lines, including those from brain, kidney, and liver. The gene, symbolized here ADDL, contains an open reading frame of 2,022 nu-

cleotides encoding 674 amino acids. It shows 54%, 53%, and 59% identity in predicted amino acid sequence with alpha and beta components of human adducin and rat adducin 63, respectively. Katagiri et al. (1996) stated that human adducin-like 70 is likely to play an important role in the skeletal organization of the cell membrane. Northern blot analysis indicated ubiquitous expression of this gene in adult human tissues. In a comprehensive assay of gene expression, Gilligan et al. (1999) showed the ubiquitous expression of alpha- and gamma-adducin, in contrast to the restricted expression of beta-adducin. Beta-adducin was expressed at high levels in brain and hematopoietic tissues (bone marrow in humans, spleen in mice).

[24835] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24836] Gilligan, D. M.; Lozovatsky, L.; Gwynn, B.; Brugnara, C.; Mohandas, N.; Peters, L. L. : Targeted disruption of the beta adducin gene (Add2) causes red blood cell spherocytosis in mice. Proc. Nat. Acad. Sci. 96: 10717-10722, 1999. ; and

[24837] Katagiri, T.; Ozaki, K.; Fujiwara, T.; Shimizu, F.; Kawai, A.;

Okuno, S.; Suzuki, M.; Nakamura, Y.; Takahashi, E.; Hirai, Y. : Cloning, expression and chromosome mapping of ad-  
ducin-lik.

[24838] Further studies establishing the function and utilities of  
ADD3 are found in John Hopkins OMIM database record ID  
601568, and in cited publications numbered 2791–2792  
listed in the bibliography section hereinbelow, which are  
also hereby incorporated by reference. Activator of Basal  
Transcription 1 (ABT1, Accession NM\_013375) is another  
VGAM579 host target gene. ABT1 BINDING SITE is HOST  
TARGET binding site found in the 3` untranslated region  
of mRNA encoded by ABT1, corresponding to a HOST  
TARGET binding site such as BINDING SITE I, BINDING SITE  
II or BINDING SITE III. Table 2 illustrates the complemen-  
tarity of the nucleotide sequences of ABT1 BINDING SITE,  
designated SEQ ID:15028, to the nucleotide sequence of  
VGAM579 RNA, herein designated VGAM RNA, also desig-  
nated SEQ ID:3290.

[24839] Another function of VGAM579 is therefore inhibition of  
Activator of Basal Transcription 1 (ABT1, Accession  
NM\_013375). Accordingly, utilities of VGAM579 include  
diagnosis, prevention and treatment of diseases and clini-  
cal conditions associated with ABT1. FLJ21144 (Accession

NM\_022774) is another VGAM579 host target gene. FLJ21144 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21144 BINDING SITE, designated SEQ ID:23039, to the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, also designated SEQ ID:3290.

[24840] Another function of VGAM579 is therefore inhibition of FLJ21144 (Accession NM\_022774). Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21144. FLJ22551 (Accession NM\_024708) is another VGAM579 host target gene. FLJ22551 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22551 BINDING SITE, designated SEQ ID:24026, to the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3290.

[24841] Another function of VGAM579 is therefore inhibition of FLJ22551 (Accession NM\_024708). Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22551. KIAA0594 (Accession XM\_036117) is another VGAM579 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32384, to the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, also designated SEQ ID:3290.

[24842] Another function of VGAM579 is therefore inhibition of KIAA0594 (Accession XM\_036117). Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA1877 (Accession XM\_038616) is another VGAM579 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32883, to the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, also designated SEQ ID:3290.

[24843] Another function of VGAM579 is therefore inhibition of KIAA1877 (Accession XM\_038616). Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. TNF Receptor-associated Factor 3 (TRAF3, Accession XM\_007256) is another VGAM579 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30045, to the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, also designated SEQ ID:3290.

[24844] Another function of VGAM579 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession

XM\_007256). Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 580 (VGAM580) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24845] VGAM580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM580 was detected is described hereinabove with reference to Figs. 1–8.

[24846] VGAM580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24847] VGAM580 gene encodes a VGAM580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM580 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM580 precursor RNA is designated SEQ ID:566, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:566 is located at position 244009 relative to the genome of Fowlpox Virus.

[24848] VGAM580 precursor RNA folds onto itself, forming VGAM580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24849] An enzyme complex designated DICER COMPLEX, `dices` the VGAM580 folded precursor RNA into VGAM580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM580 RNA is designated SEQ ID:3291, and

is provided hereinbelow with reference to the sequence listing part.

[24850] VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM580 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24851] VGAM580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM580 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM580 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24852] The complementary binding of VGAM580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM580 host target RNA into VGAM580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24853] It is appreciated that VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM580 host target genes. The mRNA of each one of this plurality of VGAM580 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM580 RNA, herein designated VGAM RNA, and which when bound by VGAM580 RNA causes inhibition of translation of respective one or more VGAM580 host target proteins.

[24854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM580 gene, herein designated VGAM GENE, on one or more VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24855] It is yet further appreciated that a function of VGAM580 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM580 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM580 correlate with, and may be deduced from, the identity of the host target genes which VGAM580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24856] Nucleotide sequences of the VGAM580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM580 are further described hereinbelow with reference to Table 1.

[24857] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM580 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM580 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24858] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM580 gene, herein designated VGAM is inhibition of expression of VGAM580 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM580 correlate with, and may be deduced from, the identity of the target genes which VGAM580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24859] Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM\_005073) is a VGAM580 host target gene. SLC15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:11520, to the nucleotide sequence of VGAM580 RNA, herein designated VGAM RNA, also designated SEQ ID:3291.

[24860] A function of VGAM580 is therefore inhibition of Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM\_005073), a gene which is a H(+)-coupled peptide transporter. Accordingly, utilities of VGAM580 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SLC15A1. The function of SLC15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.FLJ10846 (Accession NM\_018241) is another VGAM580 host target gene. FLJ10846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:20201, to the nucleotide sequence of VGAM580 RNA, herein designated VGAM RNA, also designated SEQ ID:3291.

[24861] Another function of VGAM580 is therefore inhibition of FLJ10846 (Accession NM\_018241). Accordingly, utilities of VGAM580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 581 (VGAM581) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[24862] VGAM581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM581 was detected is described hereinabove with reference to Figs. 1–8.

[24863] VGAM581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24864] VGAM581 gene encodes a VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM581 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM581 precursor RNA is designated SEQ ID:567, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:567 is located at position 244236 relative to the genome of Fowlpox Virus.

[24865] VGAM581 precursor RNA folds onto itself, forming VGAM581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[24866] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM581 folded precursor RNA into VGAM581 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 91%) nucleotide se-  
quence of VGAM581 RNA is designated SEQ ID:3292, and  
is provided hereinbelow with reference to the sequence  
listing part.

[24867] VGAM581 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM581 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM581 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[24868] VGAM581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM581 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM581 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[24869] The complementary binding of VGAM581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM581 host target RNA into VGAM581 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24870] It is appreciated that VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM581 host target genes. The mRNA of each one of this plurality of VGAM581 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM581 RNA, herein designated VGAM RNA, and which when bound by VGAM581 RNA causes inhibition of translation of respective one or more VGAM581 host target proteins.

[24871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM581 gene, herein designated VGAM GENE, on one or

more VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24872] It is yet further appreciated that a function of VGAM581 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM581 correlate with, and may be deduced from, the identity of the host target genes which VGAM581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [24873] Nucleotide sequences of the VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM581 are further described hereinbelow with reference to Table 1.
- [24874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM581 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM581 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [24875] As mentioned hereinabove with reference to Fig. 1, a function of VGAM581 gene, herein designated VGAM is inhibition of expression of VGAM581 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM581 correlate with, and may be deduced from, the identity of the target genes which VGAM581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [24876] CASP8 Associated Protein 2 (CASP8AP2, Accession

NM\_012115) is a VGAM581 host target gene. CASP8AP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP8AP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8AP2 BINDING SITE, designated SEQ ID:14429, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24877] A function of VGAM581 is therefore inhibition of CASP8 Associated Protein 2 (CASP8AP2, Accession NM\_012115), a gene which interacts with and activates caspase-8 in Fas-mediated apoptosis. Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8AP2. The function of CASP8AP2 has been established by previous studies. Through coimmunoprecipitation and transfection experiments, Imai et al. (1999) determined that Flash binds caspase-8 (OMIM Ref. No. 601763) and Fadd (OMIM Ref. No. 602457). It also specifically coimmunoprecipitated with activated Fas (OMIM Ref. No. 134637), suggesting that Casp8ap2 is part of the

death-inducing signaling complex (DISC). Using luciferase reporter analysis, Choi et al. (2001) showed that inhibition of FLASH expression abolishes TNF (OMIM Ref. No. 191160)-induced NF $\kappa$ B (OMIM Ref. No. 164011) activation in embryonic kidney cells. Expression or overexpression of FLASH activates NF $\kappa$ B through a central oligomerization domain, called the NF $\kappa$ B activation domain (NAD), in a TRAF2 (OMIM Ref. No. 601895)-NIK (OMIM Ref. No. 604655)-IKKA (OMIM Ref. No. 600664)-dependent pathway. Immunoprecipitation analysis indicated that the FLASH NAD interacts with TRAF2. Choi et al. (2001) concluded that FLASH coordinates downstream NF $\kappa$ B activity via a TRAF2-dependent pathway in TNF signaling.

[24878] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24879] Choi, Y.-H.; Kim, K.-B.; Kim, H.-H.; Hong, G.-S.; Kwon, Y.-K.; Chung, C.-W.; Park, Y.-M.; Shen, Z.-J.; Kim, B. J.; Lee, S.-Y.; Jung, Y.-K. : FLASH coordinates NF- $\kappa$ B activity via TRAF2. J. Biol. Chem. 276: 25073-25077, 2001. ; and

[24880] Imai, Y.; Kimura, T.; Murakami, A.; Yajima, N.; Sakamaki, K.; Yonehara, S. : The CED-4-homologous protein FLASH

is involved in Fas-mediated activation of caspase-8 during apoptosis. Na.

[24881] Further studies establishing the function and utilities of CASP8AP2 are found in John Hopkins OMIM database record ID 606880, and in cited publications numbered 6083-6084 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM\_014395) is another VGAM581 host target gene. DAPP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAPP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPP1 BINDING SITE, designated SEQ ID:15732, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24882] Another function of VGAM581 is therefore inhibition of Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM\_014395), a gene which regulates the ras-cyclic amp pathway. Accordingly, utilities of VGAM581 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DAPP1. The function of DAPP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM283.FLJ10483 (Accession NM\_018108) is another VGAM581 host target gene. FLJ10483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10483 BINDING SITE, designated SEQ ID:19878, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24883] Another function of VGAM581 is therefore inhibition of FLJ10483 (Accession NM\_018108). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10483. FLJ10936 (Accession NM\_018279) is another VGAM581 host target gene. FLJ10936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10936, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10936 BINDING SITE, designated SEQ ID:20272, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24884] Another function of VGAM581 is therefore inhibition of FLJ10936 (Accession NM\_018279). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10936. KIAA0798 (Accession NM\_014650) is another VGAM581 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16070, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24885] Another function of VGAM581 is therefore inhibition of KIAA0798 (Accession NM\_014650). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0798. TERA (Accession NM\_021238) is another VGAM581 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:22207, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24886] Another function of VGAM581 is therefore inhibition of TERA (Accession NM\_021238). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM\_003428) is another VGAM581 host target gene. ZNF84 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF84, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF84 BINDING SITE, designated SEQ ID:9478,

to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24887] Another function of VGAM581 is therefore inhibition of Zinc Finger Protein 84 (HPF2) (ZNF84, Accession NM\_003428). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF84. LOC127255 (Accession NM\_145258) is another VGAM581 host target gene. LOC127255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127255 BINDING SITE, designated SEQ ID:29774, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24888] Another function of VGAM581 is therefore inhibition of LOC127255 (Accession NM\_145258). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127255. LOC90317 (Accession XM\_030892) is another VGAM581 host target gene. LOC90317 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:31208, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24889] Another function of VGAM581 is therefore inhibition of LOC90317 (Accession XM\_030892). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. LOC93070 (Accession XM\_049046) is another VGAM581 host target gene. LOC93070 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93070 BINDING SITE, designated SEQ ID:35327, to the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, also designated SEQ ID:3292.

[24890] Another function of VGAM581 is therefore inhibition of

LOC93070 (Accession XM\_049046). Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93070. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 582 (VGAM582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24891] VGAM582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM582 was detected is described hereinabove with reference to Figs. 1–8.

[24892] VGAM582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24893] VGAM582 gene encodes a VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM582 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM582 precursor RNA is designated SEQ ID:568, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:568 is located at position 251054 relative to the genome of Fowlpox Virus.

[24894] VGAM582 precursor RNA folds onto itself, forming VGAM582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24895] An enzyme complex designated DICER COMPLEX, `dices` the VGAM582 folded precursor RNA into VGAM582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM582 RNA is designated SEQ ID:3293, and is provided hereinbelow with reference to the sequence listing part.

[24896] VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM582 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[24897] VGAM582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM582 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24898] The complementary binding of VGAM582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM582 host target RNA into VGAM582 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24899] It is appreciated that VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM582 host target genes. The mRNA of each one of this plurality of VGAM582 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM582 RNA, herein designated VGAM RNA, and which when bound by VGAM582 RNA causes inhibition of translation of respective one or more VGAM582 host target proteins.

[24900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM582 gene, herein designated VGAM GENE, on one or more VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24901] It is yet further appreciated that a function of VGAM582 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM582 correlate with, and may be deduced from, the identity of the host target genes which VGAM582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24902] Nucleotide sequences of the VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM582 are further described hereinbelow with reference to Table 1.

[24903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM582 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM582 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24904] As mentioned hereinabove with reference to Fig. 1, a function of VGAM582 gene, herein designated VGAM is inhibition of expression of VGAM582 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM582 correlate with, and may be deduced from, the identity of the target genes which VGAM582 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24905] Mitochondrial Translational Initiation Factor 2 (MTIF2, Accession NM\_002453) is a VGAM582 host target gene. MTIF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTIF2 BINDING SITE, designated SEQ ID:8289, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, also designated SEQ ID:3293.

[24906] A function of VGAM582 is therefore inhibition of Mitochondrial Translational Initiation Factor 2 (MTIF2, Accession NM\_002453). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTIF2. Zinc Finger Pro-

tein 202 (ZNF202, Accession NM\_003455) is another VGAM582 host target gene. ZNF202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF202 BINDING SITE, designated SEQ ID:9507, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, also designated SEQ ID:3293.

[24907] Another function of VGAM582 is therefore inhibition of Zinc Finger Protein 202 (ZNF202, Accession NM\_003455). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF202. CG012 (Accession XM\_096710) is another VGAM582 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40484, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA,

also designated SEQ ID:3293.

[24908] Another function of VGAM582 is therefore inhibition of CG012 (Accession XM\_096710). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. DKFZP564C196 (Accession XM\_046405) is another VGAM582 host target gene. DKFZP564C196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564C196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:34710, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, also designated SEQ ID:3293.

[24909] Another function of VGAM582 is therefore inhibition of DKFZP564C196 (Accession XM\_046405). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. Polymerase (RNA) II (DNA directed) Polypeptide D (POLR2D, Accession NM\_004805) is another VGAM582 host target gene. POLR2D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by POLR2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR2D BINDING SITE, designated SEQ ID:11228, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, also designated SEQ ID:3293.

[24910] Another function of VGAM582 is therefore inhibition of Polymerase (RNA) II (DNA directed) Polypeptide D (POLR2D, Accession NM\_004805). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR2D. TPARG (Accession NM\_018475) is another VGAM582 host target gene. TPARG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPARG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPARG BINDING SITE, designated SEQ ID:20542, to the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, also designated SEQ ID:3293.

[24911] Another function of VGAM582 is therefore inhibition of

TPARL (Accession NM\_018475). Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPARL.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 583 (VGAM583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24912] VGAM583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM583 was detected is described hereinabove with reference to Figs. 1–8.

[24913] VGAM583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24914] VGAM583 gene encodes a VGAM583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM583 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM583 precursor RNA is designated SEQ ID:569, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:569 is located at position 274080 relative to the genome of Fowlpox Virus.

[24915] VGAM583 precursor RNA folds onto itself, forming VGAM583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24916] An enzyme complex designated DICER COMPLEX, `dices` the VGAM583 folded precursor RNA into VGAM583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM583 RNA is designated SEQ ID:3294, and

is provided hereinbelow with reference to the sequence listing part.

[24917] VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM583 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24918] VGAM583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM583 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24919] The complementary binding of VGAM583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM583 host target RNA into VGAM583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24920] It is appreciated that VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM583 host target genes. The mRNA of each one of this plurality of VGAM583 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM583 RNA, herein designated VGAM RNA, and which when bound by VGAM583 RNA causes inhibition of translation of respective one or more VGAM583 host target proteins.

[24921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM583 gene, herein designated VGAM GENE, on one or more VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24922] It is yet further appreciated that a function of VGAM583 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM583 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM583 correlate with, and may be deduced from, the identity of the host target genes which VGAM583 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24923] Nucleotide sequences of the VGAM583 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM583 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM583 are further described hereinbelow with reference to Table 1.

[24924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM583 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM583 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24925] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM583 gene, herein designated VGAM is inhibition of expression of VGAM583 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM583 correlate with, and may be deduced from, the identity of the target genes which VGAM583 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24926] Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM\_001559) is a VGAM583 host target gene. IL12RB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL12RB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12RB2 BINDING SITE, designated SEQ ID:7281, to the nucleotide sequence of VGAM583 RNA, herein designated VGAM RNA, also designated SEQ ID:3294.

[24927] A function of VGAM583 is therefore inhibition of Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM\_001559), a gene which is involved in il-12 transduction. binds to il-12 with a low affinity. Accordingly, utilities of VGAM583 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with IL12RB2. The function of IL12RB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326.FLJ00024 (Accession XM\_033361) is another VGAM583 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31887, to the nucleotide sequence of VGAM583 RNA, herein designated VGAM RNA, also designated SEQ ID:3294.

[24928] Another function of VGAM583 is therefore inhibition of FLJ00024 (Accession XM\_033361). Accordingly, utilities of VGAM583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. LOC121536 (Accession XM\_058567) is another VGAM583 host target gene. LOC121536 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121536 BINDING SITE, designated SEQ ID:36663, to the nucleotide sequence of VGAM583 RNA, herein designated VGAM RNA, also designated SEQ ID:3294.

[24929] Another function of VGAM583 is therefore inhibition of LOC121536 (Accession XM\_058567). Accordingly, utilities of VGAM583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121536. LOC221322 (Accession XM\_166323) is another VGAM583 host target gene. LOC221322 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221322 BINDING SITE, designated SEQ ID:44152, to the nucleotide sequence of VGAM583 RNA, herein designated VGAM RNA, also designated SEQ ID:3294.

[24930] Another function of VGAM583 is therefore inhibition of LOC221322 (Accession XM\_166323). Accordingly, utilities of VGAM583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221322. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 584 (VGAM584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24931] VGAM584 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM584 was detected is described hereinabove with reference to Figs. 1–8.

[24932] VGAM584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24933] VGAM584 gene encodes a VGAM584 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM584 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM584 precursor RNA is designated SEQ ID:570, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:570 is located at position 54006 relative to the genome of Fowlpox Virus.

[24934] VGAM584 precursor RNA folds onto itself, forming VGAM584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24935] An enzyme complex designated DICER COMPLEX, `dices` the VGAM584 folded precursor RNA into VGAM584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM584 RNA is designated SEQ ID:3295, and is provided hereinbelow with reference to the sequence listing part.

[24936] VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM584 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24937] VGAM584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM584 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24938] The complementary binding of VGAM584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM584 host target RNA into VGAM584 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24939] It is appreciated that VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM584 host target genes. The mRNA of each one of this plurality of VGAM584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM584 RNA, herein designated VGAM RNA, and which when bound by VGAM584 RNA causes in-

hibition of translation of respective one or more VGAM584 host target proteins.

[24940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM584 gene, herein designated VGAM GENE, on one or more VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24941] It is yet further appreciated that a function of VGAM584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM584 include diagnosis, prevention and

treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM584 correlate with, and may be deduced from, the identity of the host target genes which VGAM584 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [24942] Nucleotide sequences of the VGAM584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM584 are further described hereinbelow with reference to Table 1.
- [24943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM584 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM584 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [24944] As mentioned hereinabove with reference to Fig. 1, a function of VGAM584 gene, herein designated VGAM is inhibition of expression of VGAM584 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM584 correlate with, and may be deduced from, the identity of the target genes which VGAM584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24945] Desmoplakin (DPI, DPII) (DSP, Accession NM\_004415) is a VGAM584 host target gene. DSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSP BINDING SITE, designated SEQ ID:10678, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24946] A function of VGAM584 is therefore inhibition of Desmoplakin (DPI, DPII) (DSP, Accession NM\_004415). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSP. Retinoic Acid Induced 2 (RAI2, Accession NM\_021785) is another VGAM584 host target gene. RAI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAI2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI2 BINDING SITE, designated SEQ ID:22350, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24947] Another function of VGAM584 is therefore inhibition of Retinoic Acid Induced 2 (RAI2, Accession NM\_021785). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI2. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 4 (DYRK4, Accession XM\_034551) is another VGAM584 host target gene. DYRK4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYRK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK4 BINDING SITE, designated SEQ ID:32123, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24948] Another function of VGAM584 is therefore inhibition of

Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 4 (DYRK4, Accession XM\_034551). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK4. FLJ21032 (Accession NM\_024906) is another VGAM584 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24401, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24949] Another function of VGAM584 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. LOC219942 (Accession XM\_167790) is another VGAM584 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:44826, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24950] Another function of VGAM584 is therefore inhibition of LOC219942 (Accession XM\_167790). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219942. LOC221288 (Accession XM\_168058) is another VGAM584 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44973, to the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, also designated SEQ ID:3295.

[24951] Another function of VGAM584 is therefore inhibition of LOC221288 (Accession XM\_168058). Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 585 (VGAM585) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24952] VGAM585 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM585 was detected is described hereinabove with reference to Figs. 1–8.

[24953] VGAM585 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24954] VGAM585 gene encodes a VGAM585 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM585 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM585 precursor RNA is designated SEQ ID:571, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:571 is located at position 24033 relative to the genome of Gallid Herpesvirus 2.

[24955] VGAM585 precursor RNA folds onto itself, forming VGAM585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24956] An enzyme complex designated DICER COMPLEX, `dices` the VGAM585 folded precursor RNA into VGAM585 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM585 RNA is designated SEQ ID:3296, and is provided hereinbelow with reference to the sequence listing part.

[24957] VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM585 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24958] VGAM585 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM585 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM585 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[24959] The complementary binding of VGAM585 RNA, herein designated VGAM RNA, to host target binding sites on VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM585 host target RNA into VGAM585 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24960] It is appreciated that VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM585 host target genes. The mRNA of each one of this plurality of VGAM585 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM585 RNA, herein designated VGAM RNA, and which when bound by VGAM585 RNA causes in-

hibition of translation of respective one or more VGAM585 host target proteins.

[24961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM585 gene, herein designated VGAM GENE, on one or more VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24962] It is yet further appreciated that a function of VGAM585 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM585 include diagnosis, prevention and

treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM585 correlate with, and may be deduced from, the identity of the host target genes which VGAM585 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24963] Nucleotide sequences of the VGAM585 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM585 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM585 are further described hereinbelow with reference to Table 1.

[24964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM585 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM585 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24965] As mentioned hereinabove with reference to Fig. 1, a function of VGAM585 gene, herein designated VGAM is inhibition of expression of VGAM585 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM585 correlate with, and may be deduced from, the identity of the target genes which VGAM585 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24966] EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is a VGAM585 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41875, to the nucleotide sequence of VGAM585 RNA, herein designated VGAM RNA, also designated SEQ ID:3296.

[24967] A function of VGAM585 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. LOC165552 (Accession XM\_092666) is another VGAM585 host target gene. LOC165552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

LOC165552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165552 BINDING SITE, designated SEQ ID:40131, to the nucleotide sequence of VGAM585 RNA, herein designated VGAM RNA, also designated SEQ ID:3296.

[24968] Another function of VGAM585 is therefore inhibition of LOC165552 (Accession XM\_092666). Accordingly, utilities of VGAM585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165552. LOC200132 (Accession XM\_114126) is another VGAM585 host target gene. LOC200132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200132 BINDING SITE, designated SEQ ID:42710, to the nucleotide sequence of VGAM585 RNA, herein designated VGAM RNA, also designated SEQ ID:3296.

[24969] Another function of VGAM585 is therefore inhibition of LOC200132 (Accession XM\_114126). Accordingly, utilities

of VGAM585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200132. LOC93380 (Accession XM\_051020) is another VGAM585 host target gene. LOC93380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:35724, to the nucleotide sequence of VGAM585 RNA, herein designated VGAM RNA, also designated SEQ ID:3296.

[24970] Another function of VGAM585 is therefore inhibition of LOC93380 (Accession XM\_051020). Accordingly, utilities of VGAM585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 586 (VGAM586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24971] VGAM586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM586 was detected is described hereinabove with reference to Figs. 1–8.

[24972] VGAM586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24973] VGAM586 gene encodes a VGAM586 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM586 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM586 precursor RNA is designated SEQ ID:572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:572 is located at position 25576 relative to the genome of Gallid Herpesvirus 2.

[24974] VGAM586 precursor RNA folds onto itself, forming VGAM586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24975] An enzyme complex designated DICER COMPLEX, `dices` the VGAM586 folded precursor RNA into VGAM586 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM586 RNA is designated SEQ ID:3297, and is provided hereinbelow with reference to the sequence listing part.

[24976] VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM586 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[24977] VGAM586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM586 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24978] The complementary binding of VGAM586 RNA, herein designated VGAM RNA, to host target binding sites on VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM586 host target RNA into VGAM586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24979] It is appreciated that VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM586 host target genes. The mRNA of each one of this plurality of VGAM586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM586 RNA, herein designated VGAM RNA, and which when bound by VGAM586 RNA causes inhibition of translation of respective one or more VGAM586 host target proteins.

[24980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM586 gene, herein designated VGAM GENE, on one or more VGAM586 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24981] It is yet further appreciated that a function of VGAM586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM586 correlate with, and may be deduced from, the identity of the host target genes which VGAM586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24982] Nucleotide sequences of the VGAM586 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM586 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM586 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM586 are further  
described hereinbelow with reference to Table 1.

[24983] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM586 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM586 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[24984] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM586 gene, herein designated VGAM is  
inhibition of expression of VGAM586 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM586 correlate with, and may be deduced  
from, the identity of the target genes which VGAM586  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[24985] Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2,  
Accession NM\_020039) is a VGAM586 host target gene.

ACCN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACCN2 BINDING SITE, designated SEQ ID:21297, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24986] A function of VGAM586 is therefore inhibition of Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM\_020039). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN2. COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375) is another VGAM586 host target gene. COX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10592, to the nucleotide sequence of VGAM586

RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24987] Another function of VGAM586 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. NORE1 (Accession NM\_031437) is another VGAM586 host target gene. NORE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NORE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NORE1 BINDING SITE, designated SEQ ID:25443, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24988] Another function of VGAM586 is therefore inhibition of NORE1 (Accession NM\_031437), a gene which may modulate intracellular signal transduction pathways. Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NORE1. The function of NORE1 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM276. Solute Carrier Family 14 (urea transporter), Member 1 (Kidd blood group) (SLC14A1, Accession NM\_015865) is another VGAM586 host target gene. SLC14A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC14A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A1 BINDING SITE, designated SEQ ID:17996, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24989] Another function of VGAM586 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 1 (Kidd blood group) (SLC14A1, Accession NM\_015865), a gene which is a urea transporters in spermatogenesis. Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A1. The function of SLC14A1 has been established by previous studies. Tsukaguchi et al. (1997) undertook a characterization of the tissue distribution and

physiologic role of the erythrocyte urea transporter, UT11, by studying its rat homolog and testing whether there are additional urea transporter isoforms expressed in rat kidney. Using a PCR-based homology cloning approach with degenerate primers corresponding to conserved regions of the UT family of genes, they isolated a kidney urea transporter that appeared to be the rat homolog of human UT11. The rat gene, symbolized UT3 by them, was strongly expressed in the kidney. Furthermore, UT3 was expressed in testis, brain, bone marrow, and spleen. Its expression in the rat testis suggested a potential role for urea transporters in spermatogenesis. On in situ hybridization of testis, UT3 was detected in Sertoli cells associated with the early stages of spermatocyte development. The distribution in the kidneys suggested that UT3 is involved in counter-current exchange between ascending and descending vasa recta, to enhance the corticopapillary osmolality gradient. Although Jk-null red blood cells have reduced urea permeability, the Jk deficiency is not associated with any obvious clinical syndrome except for a urine concentration defect (Sands et al., 1992) that probably results from the absence of the Jk protein expressed on endothelial cells of the vasa recta of kidney

(Xu et al., 1997; Promeneur et al., 1996). Persons with the Jk-null phenotype are detected because antibody against Jk3 can develop after immunization by transfusion or pregnancy, and this antibody may cause immediate and delayed hemolytic transfusion reactions (Lucien et al. (2002)).

[24990] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24991] Tsukaguchi, H.; Shayakul, C.; Berger, U. V.; Tokui, T.; Brown, D.; Hediger, M. A. : Cloning and characterization of the urea transportation UT3: localization in rat kidney and testis. J. Clin. Invest. 99: 1506–1515, 1997. ; and

[24992] Sands, J. M.; Gargus, J. J.; Frohlich, O.; Gunn, R. B.; Kokko, J. P. : Urinary concentrating ability in patients with Jk(a/b) blood type who lack carrier-mediated urea transport. J. Am. Soc.

[24993] Further studies establishing the function and utilities of SLC14A1 are found in John Hopkins OMIM database record ID 111000, and in cited publications numbered 12376–12090, 9433, 12091, 12092–12094, 11251, 12095–22 and 3780–234 listed in the bibliography section hereinbelow, which are also hereby incorporated by

reference. Chromosome 6 Open Reading Frame 26 (C6orf26, Accession NM\_025259) is another VGAM586 host target gene. C6orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf26 BINDING SITE, designated SEQ ID:24929, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24994] Another function of VGAM586 is therefore inhibition of Chromosome 6 Open Reading Frame 26 (C6orf26, Accession NM\_025259). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf26. FLJ20188 (Accession NM\_017703) is another VGAM586 host target gene. FLJ20188 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20188 BINDING SITE, designated

SEQ ID:19275, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24995] Another function of VGAM586 is therefore inhibition of FLJ20188 (Accession NM\_017703). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20188. LOC221143 (Accession XM\_167986) is another VGAM586 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44945, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24996] Another function of VGAM586 is therefore inhibition of LOC221143 (Accession XM\_167986). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. LOC253918 (Accession XM\_171345) is another VGAM586 host target gene. LOC253918 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253918 BINDING SITE, designated SEQ ID:46042, to the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, also designated SEQ ID:3297.

[24997] Another function of VGAM586 is therefore inhibition of LOC253918 (Accession XM\_171345). Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 587 (VGAM587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24998] VGAM587 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM587 was detected is described hereinabove with reference to Figs. 1-8.

[24999] VGAM587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25000] VGAM587 gene encodes a VGAM587 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM587 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM587 precursor RNA is designated SEQ ID:573, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:573 is located at position 24271 relative to the genome of Gallid Herpesvirus 2.

[25001] VGAM587 precursor RNA folds onto itself, forming VGAM587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[25002] An enzyme complex designated DICER COMPLEX, `dices` the VGAM587 folded precursor RNA into VGAM587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM587 RNA is designated SEQ ID:3298, and is provided hereinbelow with reference to the sequence listing part.

[25003] VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM587 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25004] VGAM587 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM587 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM587 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[25005] The complementary binding of VGAM587 RNA, herein designated VGAM RNA, to host target binding sites on VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM587 host target RNA into VGAM587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25006] It is appreciated that VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM587 host target genes. The mRNA of each one of this plurality of VGAM587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM587 RNA, herein designated VGAM RNA, and which when bound by VGAM587 RNA causes inhibition of translation of respective one or more VGAM587 host target proteins.

[25007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM587 gene, herein designated VGAM GENE, on one or more VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25008] It is yet further appreciated that a function of VGAM587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM587 correlate with, and may be deduced from, the identity of the host target genes which VGAM587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25009] Nucleotide sequences of the VGAM587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM587 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM587 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM587 are further described hereinbelow with reference to Table 1.

[25010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM587 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25011] As mentioned hereinabove with reference to Fig. 1, a function of VGAM587 gene, herein designated VGAM is inhibition of expression of VGAM587 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM587 correlate with, and may be deduced from, the identity of the target genes which VGAM587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25012] Desmocollin 3 (DSC3, Accession NM\_001941) is a VGAM587 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2, designated SEQ ID:7652 and SEQ ID:23663 respectively, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25013] A function of VGAM587 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM\_001941), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM230. Solute Carrier Family 14 (urea transporter), Member 1 (Kidd blood group) (SLC14A1, Accession NM\_015865) is another VGAM587 host target gene. SLC14A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC14A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A1 BINDING SITE, designated SEQ ID:17995, to the nucleotide sequence of VGAM587 RNA,

herein designated VGAM RNA, also designated SEQ ID:3298.

[25014] Another function of VGAM587 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 1 (Kidd blood group) (SLC14A1, Accession NM\_015865), a gene which is a urea transporters in spermatogenesis. Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A1. The function of SLC14A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM586. Chromosome 8 Open Reading Frame 4 (C8orf4, Accession NM\_020130) is another VGAM587 host target gene. C8orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf4 BINDING SITE, designated SEQ ID:21324, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25015] Another function of VGAM587 is therefore inhibition of

Chromosome 8 Open Reading Frame 4 (C8orf4, Accession NM\_020130). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf4. FLJ10700 (Accession NM\_018182) is another VGAM587 host target gene. FLJ10700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10700 BINDING SITE, designated SEQ ID:20018, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25016] Another function of VGAM587 is therefore inhibition of FLJ10700 (Accession NM\_018182). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10700. FLJ20276 (Accession NM\_017738) is another VGAM587 host target gene. FLJ20276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:19326, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25017] Another function of VGAM587 is therefore inhibition of FLJ20276 (Accession NM\_017738). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276. FLJ21839 (Accession NM\_021831) is another VGAM587 host target gene. FLJ21839 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21839 BINDING SITE, designated SEQ ID:22405, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25018] Another function of VGAM587 is therefore inhibition of FLJ21839 (Accession NM\_021831). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21839.

LOC163682 (Accession XM\_099402) is another VGAM587 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42082, to the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, also designated SEQ ID:3298.

[25019] Another function of VGAM587 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC169026 (Accession XM\_095471) is another VGAM587 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40259, to the nucleotide sequence of VGAM587 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3298.

[25020] Another function of VGAM587 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 588 (VGAM588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25021] VGAM588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM588 was detected is described hereinabove with reference to Figs. 1–8.

[25022] VGAM588 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25023] VGAM588 gene encodes a VGAM588 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM588 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM588 precursor RNA is designated SEQ ID:574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:574 is located at position 41654 relative to the genome of Gallid Herpesvirus 2.

[25024] VGAM588 precursor RNA folds onto itself, forming VGAM588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25025] An enzyme complex designated DICER COMPLEX, `dices` the VGAM588 folded precursor RNA into VGAM588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM588 RNA is designated SEQ ID:3299, and is provided hereinbelow with reference to the sequence listing part.

[25026] VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM588 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[25027] VGAM588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM588 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25028] The complementary binding of VGAM588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM588 host target RNA into VGAM588 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25029] It is appreciated that VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM588 host target genes. The mRNA of

each one of this plurality of VGAM588 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM588 RNA, herein designated VGAM RNA, and which when bound by VGAM588 RNA causes inhibition of translation of respective one or more VGAM588 host target proteins.

[25030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM588 gene, herein designated VGAM GENE, on one or more VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[25031] It is yet further appreciated that a function of VGAM588 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM588 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM588 correlate with, and may be deduced from, the identity of the host target genes which VGAM588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25032] Nucleotide sequences of the VGAM588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM588 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM588 are further described hereinbelow with reference to Table 1.

[25033] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM588 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM588 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[25034] As mentioned hereinabove with reference to Fig. 1, a function of VGAM588 gene, herein designated VGAM is inhibition of expression of VGAM588 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM588 correlate with, and may be deduced from, the identity of the target genes which VGAM588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25035] Activating Transcription Factor 5 (ATF5, Accession NM\_012068) is a VGAM588 host target gene. ATF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF5 BINDING SITE, designated SEQ ID:14320, to the nucleotide sequence of VGAM588 RNA, herein designated VGAM RNA, also designated SEQ ID:3299.

[25036] A function of VGAM588 is therefore inhibition of Activating Transcription Factor 5 (ATF5, Accession NM\_012068), a gene which binds to cAMP-inducible promoters and is

involved in gene transcription. Accordingly, utilities of VGAM588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF5. The function of ATF5 has been established by previous studies. Using a yeast 2-hybrid screen with CDC34 (OMIM Ref. No. 116948) as the bait, Pati et al. (1999) obtained a partial cDNA encoding ATF5. The deduced 122-amino acid protein contains a C-terminal bZIP motif with only 3 leucines instead of the conventional 5; the 2 distal leucines are replaced by valines. Functional analysis showed that ATF5 is degraded by ubiquitin proteasome machinery in a CDC34- and RAD6B (UBE2B; 179095)-dependent pathway. Using a yeast 2-hybrid screen with PRL1 (PTP4A1; 601585) as the bait, Peters et al. (2001) identified a cDNA encoding ATF5, which they termed ATF7. EMSA analysis indicated that ATF5 binds to CRE but not C/EBP oligonucleotides. Northern blot analysis revealed ubiquitous expression of ATF5, with highest levels in liver, lung, adipose tissue, heart, and skeletal muscle. Coimmunoprecipitation and GST pull-down analyses confirmed the association of the C-terminal bZIP motif of ATF5 with the PTPase domain and adjacent residues of PRL1 in vitro. SDS-PAGE analysis showed that

PRL1 dephosphorylates ATF5.

[25037] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25038] Pati, D.; Meistrich, M. L.; Plon, S. E. : Human Cdc34 and Rad6B ubiquitin–conjugating enzymes target repressors of cyclic AMP–induced transcription for proteolysis. *Molec. Cell. Biol.* 19: 5001–5013, 1999. ; and

[25039] Peters, C. S.; Liang, X.; Li, S.; Kannan, S.; Peng, Y.; Taub, R.; Diamond, R. H. : ATF–7, a novel bZIP protein, interacts with the PRL–1 protein–tyrosine phosphatase. *J. Biol. Chem.* 276.

[25040] Further studies establishing the function and utilities of ATF5 are found in John Hopkins OMIM database record ID 606398, and in cited publications numbered 451 and 4523–4524 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM\_168403) is another VGAM588 host target gene. FKBP9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus–

trates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:45144, to the nucleotide sequence of VGAM588 RNA, herein designated VGAM RNA, also designated SEQ ID:3299.

[25041] Another function of VGAM588 is therefore inhibition of FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM\_168403). Accordingly, utilities of VGAM588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 589 (VGAM589) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25042] VGAM589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM589 was detected is described hereinabove with reference to Figs. 1–8.

[25043] VGAM589 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[25044] VGAM589 gene encodes a VGAM589 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM589 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM589 precursor RNA is designated SEQ ID:575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:575 is located at position 37271 relative to the genome of Gallid Herpesvirus 2.

[25045] VGAM589 precursor RNA folds onto itself, forming VGAM589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25046] An enzyme complex designated DICER COMPLEX, `dices` the VGAM589 folded precursor RNA into VGAM589 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM589 RNA is designated SEQ ID:3300, and is provided hereinbelow with reference to the sequence listing part.

[25047] VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM589 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25048] VGAM589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM589 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25049] The complementary binding of VGAM589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM589 host target RNA into VGAM589 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25050] It is appreciated that VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM589 host target genes. The mRNA of each one of this plurality of VGAM589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM589 RNA, herein designated VGAM RNA, and which when bound by VGAM589 RNA causes inhibition of translation of respective one or more VGAM589 host target proteins.

[25051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM589 gene, herein designated VGAM GENE, on one or more VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25052] It is yet further appreciated that a function of VGAM589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM589 correlate with, and may be deduced from, the identity of the host target genes which VGAM589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25053] Nucleotide sequences of the VGAM589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM589 are further described hereinbelow with reference to Table 1.

[25054] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM589 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25055] As mentioned hereinabove with reference to Fig. 1, a function of VGAM589 gene, herein designated VGAM is inhibition of expression of VGAM589 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM589 correlate with, and may be deduced from, the identity of the target genes which VGAM589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25056] B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993) is a VGAM589 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21994, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25057] A function of VGAM589 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. Deoxyguanosine Kinase (DGUOK, Accession NM\_080915) is another VGAM589 host target gene. DGUOK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGUOK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGUOK BINDING SITE, designated SEQ ID:28135, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25058] Another function of VGAM589 is therefore inhibition of Deoxyguanosine Kinase (DGUOK, Accession NM\_080915), a gene which is deoxyguanosine kinase and mediates phosphorylation of several deoxyribonucleosides. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGUOK. The function of DGUOK and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM121. Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM\_004414) is another VGAM589 host target gene. DSCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1 BINDING SITE, designated SEQ ID:10675, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25059] Another function of VGAM589 is therefore inhibition of Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM\_004414), a gene which inhibits calcineurin-dependent transcriptional responses. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1. The function of DSCR1 has been established by previous studies. The study of patients with partial trisomy 21 has defined an area of approximately 3 Mb at chromosomal region 21q22 as the minimal candidate region for the Down syndrome phenotype (OMIM Ref. No. 190685). Us-

ing a novel exon cloning strategy, Fuentes et al. (1995) identified several putative exons from region 21q22.1–q22.2. One exon was used to isolate fetal brain cDNAs corresponding to a gene that the authors designated DSCR1. The predicted 171–amino acid protein contains 2 proline–rich regions, a putative DNA–binding domain, and an acidic region. Northern blot analysis revealed that the 2.2–kb DSCR1 transcript is expressed at the highest levels in fetal brain and adult heart and at lower levels in various other tissues. An additional 2–kb mRNA was detected in fetal and adult liver. Increased expression in the brains of young rats compared with adults suggested to Fuentes et al. (1995) that DSCR1 plays a role during central nervous system development. Fuentes et al. (1997) determined that DSCR1 spans nearly 45 kb and contains 7 exons, 4 of which are alternative first exons. They found tissue–specific expression patterns for the alternative transcripts. Kingsbury and Cunningham (2000) referred to the proteins encoded by the MCIP genes as calciopressins. Functional analysis showed that when expressed in yeast, DSCR1 and ZAKI4 inhibited calcineurin function. The authors proposed that increased expression of DSCR1 in trisomy–21 individuals may contribute to the

neurologic, cardiac, or immunologic defects of Down syndrome.

[25060] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25061] Fuentes, J. J.; Pritchard, M. A.; Estivill, X. : Genomic organization, alternative splicing, and expression patterns of the DSCR1 (Down syndrome candidate region 1) gene. *Genomics* 44: 358–361, 1997. ; and

[25062] Kingsbury, T. J.; Cunningham, K. W. : A conserved family of calcineurin regulators. *Genes Dev.* 14: 1595–1604, 2000.

[25063] Further studies establishing the function and utilities of DSCR1 are found in John Hopkins OMIM database record ID 602917, and in cited publications numbered 6049, 6192–619 and 5335–5336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878) is another VGAM589 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6575, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25064] Another function of VGAM589 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM\_000918) is another VGAM589 host target gene. P4HB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P4HB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of P4HB BINDING SITE, designated SEQ ID:6628, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25065] Another function of VGAM589 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM\_000918), a gene which catalyzes formation of 4-hydroxyproline in collagens. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HB. The function of P4HB has been established by previous studies. Prolyl 4-hydroxylase (EC 1.14.11.2) is involved in hydroxylation of prolyl residues in procollagen. Pihlajaniemi et al. (1987) cloned the PROHB gene. Prolyl 4-hydroxylase is a tetramer consisting of 2 alpha (176710, 600608) and 2 beta subunits of molecular weights about 64,000 and 60,000, respectively, for the monomers. Characterization of cDNA clones for the human beta subunit indicated that the polypeptide is 508 amino acids long, including a signal peptide of 17 amino acids. Pihlajaniemi et al. (1987) also found that disulfide

isomerase (EC 5.3.4.1) is a product of the same gene. When present in cells in monomeric form, the protein serves the function of DSI (Koivu et al., 1987); when present in the prolyl 4-hydroxylase tetramer, it catalyzes the formation of 4-hydroxyproline in collagen. Cheng et al. (1987) demonstrated by molecular cloning and nucleotide sequencing that cellular thyroid hormone-binding protein is also identical to the beta subunit of prolyl 4-hydroxylase and protein disulfide isomerase. Tasanen et al. (1988) isolated genomic clones for the human gene coding for this multifunctional protein. They found that the gene is about 18 kb long and consists of 11 exons. The codons for the 2 presumed active sites of protein disulfide isomerase, each a cys-gly-his-cys sequence, were found to be located 12 bp from the beginning of exons 2 and 9. Another of the many functions of protein disulfide isomerase is its role as the smaller element of the heterodimeric microsomal triglyceride transfer protein (MTP; 157147). The unique larger subunit of this heterodimer is mutant in patients with abetalipoproteinemia (OMIM Ref. No. 200100). Since chylomicrons, very low density lipoproteins, and low density lipoproteins are absent from the plasma in abetalipoproteinemic subjects,

and since the clinical pathology of abetalipoproteinemia results from deficiency of fat-soluble vitamins that are transported on apoB-containing lipoproteins, Sharp et al. (1993) proposed that inhibition of MTP may provide a specific mechanism for lowering plasma cholesterol and triglyceride levels.

[25066] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25067] Pihlajaniemi, T.; Helaakoski, T.; Tasanen, K.; Myllyla, R.; Huhtala, M.-L.; Koivu, J.; Kivirikko, K. I. : Molecular cloning of the beta-subunit of human prolyl 4-hydroxylase: this subunit and protein disulphide isomerase are products of the same gene. EMBO J. 6: 643-649, 1987. ; and

[25068] Sharp, D.; Blinderman, L.; Combs, K. A.; Kienzle, B.; Ricci, B.; Wager-Smith, K.; Gil, C. M.; Turck, C. W.; Bouma, M.-E.; Rader, D. J.; Aggerbeck, L. P.; Gregg, R. E.; Gordon, D. A.; We.

[25069] Further studies establishing the function and utilities of P4HB are found in John Hopkins OMIM database record ID 176790, and in cited publications numbered 9725-9734, 329 and 9735 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.poly(A)-specific Ribonuclease (deadenylation nuclease) (PARN, Accession NM\_002582) is another VGAM589 host target gene. PARN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PARN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARN BINDING SITE, designated SEQ ID:8444, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25070] Another function of VGAM589 is therefore inhibition of poly(A)-specific Ribonuclease (deadenylation nuclease) (PARN, Accession NM\_002582), a gene which degrades mRNA poly(A) tails during oocyte maturation. Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARN. The function of PARN has been established by previous studies. Exonucleolytic degradation of the poly(A) tail is often the first step in the decay of eukaryotic mRNAs. Korner and Wahle (1997) purified the enzyme for deadenylation, PARN, which they named DAN, from calf thymus. Korner et al. (1998) partially sequenced the

bovine PARN protein. By searching an EST database with the bovine PARN peptide sequences, they identified a human PARN EST encoding a deduced 639-amino acid protein. The calculated molecular mass of human PARN is 73.5 kD, which was the mass of recombinant PARN expressed in *E. coli*. The human PARN protein shows sequence similarity to the RNase D family of 3-prime exonucleases, which includes *E. coli* polymerase I. PARN is a 3-prime exonuclease that prefers poly(A) as the substrate. In an in vitro assay, PARN activity was partially inhibited by PAB1 (OMIM Ref. No. 604679), resulting in phased shortening of the poly(A) tail of the polyadenylated RNA substrate. The PARN protein is located in both the nucleus and the cytoplasm. It is not stably associated with polysomes or ribosomal subunits. Northern blot analysis detected a 3.1-kb PARN transcript in HeLa cell extracts. The authors noted that the PARN gene is widely expressed. Korner et al. (1998) noted that the PARN gene maps to chromosome 16.

[25071] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25072] Korner, C. G.; Wahle, E. : Poly(A) tail shortening by a

mammalian poly(A)-specific 3-prime-exoribonuclease. J. Biol. Chem. 272: 10448-10456, 1997. ; and

[25073] Korner, C. G.; Wormington, M.; Muckenthaler, M.; Schneider, S.; Dehlin, E.; Wahle, E. : The deadenylating nuclease (DAN) is involved in poly(A) tail removal during the meiotic maturation.

[25074] Further studies establishing the function and utilities of PARN are found in John Hopkins OMIM database record ID 604212, and in cited publications numbered 4921-4922 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoribosyl Pyrophosphate Amidotransferase (PPAT, Accession NM\_002703) is another VGAM589 host target gene. PPAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPAT BINDING SITE, designated SEQ ID:8551, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25075] Another function of VGAM589 is therefore inhibition of Phosphoribosyl Pyrophosphate Amidotransferase (PPAT,

Accession NM\_002703). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPAT. Alpha 1,4-galactosyltransferase (A4GALT, Accession NM\_017436) is another VGAM589 host target gene. A4GALT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by A4GALT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A4GALT BINDING SITE, designated SEQ ID:18896, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25076] Another function of VGAM589 is therefore inhibition of Alpha 1,4-galactosyltransferase (A4GALT, Accession NM\_017436). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A4GALT. FLJ20309 (Accession NM\_017759) is another VGAM589 host target gene. FLJ20309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20309, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20309 BINDING SITE, designated SEQ ID:19371, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25077] Another function of VGAM589 is therefore inhibition of FLJ20309 (Accession NM\_017759). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20309. FLJ21916 (Accession NM\_023112) is another VGAM589 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23384, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25078] Another function of VGAM589 is therefore inhibition of FLJ21916 (Accession NM\_023112). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21916. KIAA1089 (Accession XM\_044148) is another VGAM589 host target gene. KIAA1089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1089 BINDING SITE, designated SEQ ID:34142, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25079] Another function of VGAM589 is therefore inhibition of KIAA1089 (Accession XM\_044148). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1089. KIAA1538 (Accession XM\_049474) is another VGAM589 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35433, to the

nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25080] Another function of VGAM589 is therefore inhibition of KIAA1538 (Accession XM\_049474). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. Sideroflexin 5 (SFXN5, Accession NM\_144579) is another VGAM589 host target gene. SFXN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, designated SEQ ID:29389, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25081] Another function of VGAM589 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NM\_144579). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN5. WD Repeat Domain 13 (WDR13, Accession NM\_017883) is another VGAM589 host target gene. WDR13 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by WDR13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR13 BINDING SITE, designated SEQ ID:19552, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25082] Another function of VGAM589 is therefore inhibition of WD Repeat Domain 13 (WDR13, Accession NM\_017883). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR13. LOC124997 (Accession XM\_058886) is another VGAM589 host target gene. LOC124997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124997 BINDING SITE, designated SEQ ID:36787, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25083] Another function of VGAM589 is therefore inhibition of LOC124997 (Accession XM\_058886). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124997. LOC150174 (Accession XM\_086802) is another VGAM589 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38875, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25084] Another function of VGAM589 is therefore inhibition of LOC150174 (Accession XM\_086802). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC150213 (Accession XM\_059324) is another VGAM589 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36962, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25085] Another function of VGAM589 is therefore inhibition of LOC150213 (Accession XM\_059324). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC150236 (Accession XM\_086824) is another VGAM589 host target gene. LOC150236 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150236 BINDING SITE, designated SEQ ID:38907, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25086] Another function of VGAM589 is therefore inhibition of LOC150236 (Accession XM\_086824). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150236. LOC153218 (Accession XM\_087628) is another VGAM589 host target gene. LOC153218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153218 BINDING SITE, designated SEQ ID:39365, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25087] Another function of VGAM589 is therefore inhibition of LOC153218 (Accession XM\_087628). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153218. LOC154525 (Accession XM\_098554) is another VGAM589 host target gene. LOC154525 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154525 BINDING SITE, designated SEQ ID:41708, to the nucleotide sequence of VGAM589 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3300.

[25088] Another function of VGAM589 is therefore inhibition of LOC154525 (Accession XM\_098554). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154525. LOC200261 (Accession XM\_114172) is another VGAM589 host target gene. LOC200261 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200261 BINDING SITE, designated SEQ ID:42751, to the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, also designated SEQ ID:3300.

[25089] Another function of VGAM589 is therefore inhibition of LOC200261 (Accession XM\_114172). Accordingly, utilities of VGAM589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200261. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 590 (VGAM590) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25090] VGAM590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM590 was detected is described hereinabove with reference to Figs. 1–8.

[25091] VGAM590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25092] VGAM590 gene encodes a VGAM590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM590 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM590 precursor RNA is designated SEQ ID:576, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:576 is located at position 37055 relative to the genome of Gallid Herpesvirus 2.

[25093] VGAM590 precursor RNA folds onto itself, forming

VGAM590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM590 folded precursor RNA into VGAM590 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM590 RNA is designated SEQ ID:3301, and is provided hereinbelow with reference to the sequence listing part.

[25095] VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM590 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[25096] VGAM590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM590 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM590 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25097] The complementary binding of VGAM590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM590 host target RNA into VGAM590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25098] It is appreciated that VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM590 host target genes. The mRNA of each one of this plurality of VGAM590 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM590 RNA, herein designated VGAM RNA, and which when bound by VGAM590 RNA causes inhibition of translation of respective one or more VGAM590 host target proteins.

[25099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM590 gene, herein designated VGAM GENE, on one or more VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25100] It is yet further appreciated that a function of VGAM590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM590 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM590 correlate with, and may be deduced from, the identity of the host target genes which VGAM590 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[25101] Nucleotide sequences of the VGAM590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM590 are further described hereinbelow with reference to Table 1.

[25102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM590 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM590 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM590 gene, herein designated VGAM is inhibition of expression of VGAM590 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM590 correlate with, and may be deduced from, the identity of the target genes which VGAM590 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[25104] Translin (TSN, Accession NM\_004622) is a VGAM590 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10982, to the nucleotide sequence of VGAM590 RNA, herein designated VGAM RNA, also designated SEQ ID:3301.

[25105] A function of VGAM590 is therefore inhibition of Translin (TSN, Accession NM\_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.KIAA0318 (Accession XM\_044334) is another VGAM590 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34184, to the nucleotide sequence of VGAM590 RNA, herein designated VGAM RNA, also designated SEQ ID:3301.

[25106] Another function of VGAM590 is therefore inhibition of KIAA0318 (Accession XM\_044334). Accordingly, utilities of VGAM590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0318. LOC142779 (Accession XM\_084337) is another VGAM590 host target gene. LOC142779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142779 BINDING SITE, designated SEQ ID:37558, to the nucleotide sequence of VGAM590 RNA, herein designated VGAM RNA, also designated SEQ ID:3301.

[25107] Another function of VGAM590 is therefore inhibition of LOC142779 (Accession XM\_084337). Accordingly, utilities

of VGAM590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142779. LOC200609 (Accession XM\_117256) is another VGAM590 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43323, to the nucleotide sequence of VGAM590 RNA, herein designated VGAM RNA, also designated SEQ ID:3301.

[25108] Another function of VGAM590 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 591 (VGAM591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25109] VGAM591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM591 was detected is described hereinabove with reference to Figs. 1–8.

[25110] VGAM591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25111] VGAM591 gene encodes a VGAM591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM591 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM591 precursor RNA is designated SEQ ID:577, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:577 is located at position 47365 relative to the genome of Gallid Herpesvirus 2.

[25112] VGAM591 precursor RNA folds onto itself, forming VGAM591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25113] An enzyme complex designated DICER COMPLEX, `dices` the VGAM591 folded precursor RNA into VGAM591 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM591 RNA is designated SEQ ID:3302, and is provided hereinbelow with reference to the sequence listing part.

[25114] VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM591 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[25115] VGAM591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM591 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM591 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25116] The complementary binding of VGAM591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM591 host target RNA into VGAM591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25117] It is appreciated that VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM591 host target genes. The mRNA of each one of this plurality of VGAM591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM591 RNA, herein designated VGAM RNA, and which when bound by VGAM591 RNA causes inhibition of translation of respective one or more VGAM591 host target proteins.

[25118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM591 gene, herein designated VGAM GENE, on one or more VGAM591 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25119] It is yet further appreciated that a function of VGAM591 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM591 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM591 correlate with, and may be deduced from, the identity of the host target genes which VGAM591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25120] Nucleotide sequences of the VGAM591 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM591 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM591 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM591 are further  
described hereinbelow with reference to Table 1.

[25121] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM591 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM591 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[25122] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM591 gene, herein designated VGAM is  
inhibition of expression of VGAM591 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM591 correlate with, and may be deduced  
from, the identity of the target genes which VGAM591  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[25123] LOC153196 (Accession XM\_098323) is a VGAM591 host  
target gene. LOC153196 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41593, to the nucleotide sequence of VGAM591 RNA, herein designated VGAM RNA, also designated SEQ ID:3302.

[25124] A function of VGAM591 is therefore inhibition of LOC153196 (Accession XM\_098323). Accordingly, utilities of VGAM591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC158014 (Accession XM\_088442) is another VGAM591 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39690, to the nucleotide sequence of VGAM591 RNA, herein designated VGAM RNA, also designated SEQ ID:3302.

[25125] Another function of VGAM591 is therefore inhibition of

LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158318 (Accession XM\_098925) is another VGAM591 host target gene. LOC158318 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158318 BINDING SITE, designated SEQ ID:41959, to the nucleotide sequence of VGAM591 RNA, herein designated VGAM RNA, also designated SEQ ID:3302.

[25126] Another function of VGAM591 is therefore inhibition of LOC158318 (Accession XM\_098925). Accordingly, utilities of VGAM591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158318. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 592 (VGAM592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[25127] VGAM592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM592 was detected is described hereinabove with reference to Figs. 1–8.

[25128] VGAM592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25129] VGAM592 gene encodes a VGAM592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM592 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM592 precursor RNA is designated SEQ ID:578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:578 is located at position 44626 relative to the genome of Gallid Herpesvirus 2.

[25130] VGAM592 precursor RNA folds onto itself, forming VGAM592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[25131] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM592 folded precursor RNA into VGAM592 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 44%) nucleotide se-  
quence of VGAM592 RNA is designated SEQ ID:3303, and  
is provided hereinbelow with reference to the sequence  
listing part.

[25132] VGAM592 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM592 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM592 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[25133] VGAM592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM592 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM592 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[25134] The complementary binding of VGAM592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM592 host target RNA into VGAM592 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25135] It is appreciated that VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM592 host target genes. The mRNA of each one of this plurality of VGAM592 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM592 RNA, herein designated VGAM RNA, and which when bound by VGAM592 RNA causes inhibition of translation of respective one or more VGAM592 host target proteins.

[25136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM592 gene, herein designated VGAM GENE, on one or

more VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25137] It is yet further appreciated that a function of VGAM592 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM592 correlate with, and may be deduced from, the identity of the host target genes which VGAM592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [25138] Nucleotide sequences of the VGAM592 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM592 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM592 are further described hereinbelow with reference to Table 1.
- [25139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM592 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM592 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [25140] As mentioned hereinabove with reference to Fig. 1, a function of VGAM592 gene, herein designated VGAM is inhibition of expression of VGAM592 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM592 correlate with, and may be deduced from, the identity of the target genes which VGAM592 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [25141] BN51 (BHK21) Temperature Sensitivity Complementing

(BN51T, Accession XM\_113557) is a VGAM592 host target gene. BN51T BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BN51T, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BN51T BINDING SITE, designated SEQ ID:42284, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25142] A function of VGAM592 is therefore inhibition of BN51 (BHK21) Temperature Sensitivity Complementing (BN51T, Accession XM\_113557), a gene which complements a temperature-sensitive cell cycle mutation in BHK cells. Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BN51T. The function of BN51T has been established by previous studies. Two temperature-sensitive mutants have been isolated from the BHK-21 Syrian hamster cell line. Both of the human genes that complement these mutations, designated ts11 and tsBN51, lead to a block in progression through the G1 phase of the cell cycle at nonpermissive temperatures. Ts11 has been identi-

fied as asparagine synthetase; see 108370. The tsBN51 gene encodes a highly charged novel protein of 395 amino acids (Ittmann et al., 1987) whose biochemical function had not yet been determined when Greco et al. (1989) assigned the gene to 8q21 by study of rodent-human hybrid cells and by in situ hybridization using a tsBN51 probe. This is one of a considerable number of temperature-sensitive mutants which have been mapped to various autosomes and in several instances to the X chromosome.

[25143] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25144] Ittmann, M.; Greco, A.; Basilico, C. : Isolation of the human gene that complements a temperature-sensitive cell cycle mutation in BHK cells. *Molec. Cell. Biol.* 7: 3386-3393, 1987. ; and

[25145] Greco, A.; Ittmann, M.; Barletta, C.; Basilico, C.; Croce, C. M.; Cannizzaro, L. A.; Huebner, K. : Chromosomal localization of human genes required for G(1) progression in mammalian cell.

[25146] Further studies establishing the function and utilities of BN51T are found in John Hopkins OMIM database record

ID 187280, and in cited publications numbered 12373–12374 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM\_004064) is another VGAM592 host target gene. CDKN1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1B BINDING SITE, designated SEQ ID:10274, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25147] Another function of VGAM592 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM\_004064), a gene which is involved in g1 arrest and may mediate tgfbeta-induced g1 arrest. Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1B. The function of CDKN1B has been established by previous studies. Stegmaier et al. (1995) studied loss of heterozygosity (LOH) in the region

12p13–p12 in acute lymphoblastic leukemia; this chromosomal region often shows deletion in such patients. In 15% of informative patients, there was evidence of LOH of the TEL locus (OMIM Ref. No. 600618) which was not evident on cytogenetic analysis. Detailed examination of patients with LOH showed that the critically deleted region included a second candidate tumor suppressor gene, referred to by them as KIP1, which encodes the cyclin-dependent kinase inhibitor previously called p27 (Toyoshima and Hunter, 1994 and Polyak et al., 1994). Based on the STS content of TEL-positive YACs, Stegmaier et al. (1995) reported that KIP1 and TEL were in close proximity. Apoptosis of human endothelial cells after growth factor deprivation is associated with rapid and dramatic upregulation of cyclin A-associated CDK2 activity. Levkau et al. (1998) showed that in apoptotic cells the carboxyl-termini of the CDK inhibitors CDKN1A (OMIM Ref. No. 116899) and CDKN1B are truncated by specific cleavage. The enzyme involved in this cleavage is CASP3 (OMIM Ref. No. 600636) and/or a CASP3-like caspase. After cleavage, CDKN1A loses its nuclear localization sequence and exits the nucleus. Cleavage of CDKN1A and CDKN1B resulted in a substantial reduction in their asso-

ciation with nuclear cyclin-CDK2 complexes, leading to a dramatic induction of CDK2 activity. Dominant-negative CDK2, as well as a mutant CDKN1A resistant to caspase cleavage, partially suppressed apoptosis. These data suggested that CDK2 activation, through caspase-mediated cleavage of CDK inhibitors, may be instrumental in the execution of apoptosis following caspase activation.

[25148] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25149] Levkau, B.; Koyama, H.; Raines, E. W.; Clurman, B. E.; Herren, B.; Orth, K.; Roberts, J. M.; Ross, R. : Cleavage of p21(Cip1/Waf1) and p27(Kip1) mediates apoptosis in endothelial cells through activation of Cdk2: role of a caspase cascade. *Molec. Cell* 1: 553-563, 1998. ; and

[25150] Stegmaier, K.; Pendse, S.; Barker, G. F.; Bray-Ward, P.; Ward, D. C.; Montgomery, K. T.; Krauter, K. S.; Reynolds, C.; Sklar, J.; Donnelly, M.; Bohlander, S. K.; Rowley, J. D.; Sallan.

[25151] Further studies establishing the function and utilities of CDKN1B are found in John Hopkins OMIM database record ID 600778, and in cited publications numbered 5665, 9927-9930, 7124, 9936-9937, 12194, 9939-9940,

4705, 994 and 9942 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Laminin, Gamma 2 (LAMC2, Accession NM\_005562) is another VGAM592 host target gene. LAMC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC2 BINDING SITE, designated SEQ ID:12090, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25152] Another function of VGAM592 is therefore inhibition of Laminin, Gamma 2 (LAMC2, Accession NM\_005562). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC2. PAG (Accession NM\_018440) is another VGAM592 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING

SITE, designated SEQ ID:20512, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25153] Another function of VGAM592 is therefore inhibition of PAG (Accession NM\_018440). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Retinoblastoma-like 1 (p107) (RBL1, Accession NM\_002895) is another VGAM592 host target gene. RBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBL1 BINDING SITE, designated SEQ ID:8802, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25154] Another function of VGAM592 is therefore inhibition of Retinoblastoma-like 1 (p107) (RBL1, Accession NM\_002895), a gene which has an important role in negatively regulating the rate of progression of the cell cycle. Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RBL1. The function of RBL1 has been established by previous studies. The cellular protein p107, like the retinoblastoma gene product (OMIM Ref. No. 180200), has been shown to form a specific complex with adenovirus E1A and SV40 large T antigen (T). The binding characteristics implied that RB1 and p107 share a common biochemical function. Ewen et al. (1991) used a partial cDNA for human p107 to map the gene to 20q11.2 by fluorescence in situ hybridization. The cDNA encoded a 936-residue protein. Comparison with RB1 showed a major region of homology extending over 564 residues. This region in RB1 is essential to its growth-controlling function. Sequences outside of this region are largely unique to each protein. Animal model experiments lend further support to the function of RBL1. LeCouter et al. (1998) introduced a null mutation in p107 into the germ line of mice and bred into a BALB/cJ genetic background. Mice lacking p107 were viable and fertile but displayed impaired growth, reaching about 50% of normal weight by 21 days of age. Mutant mice exhibited a myeloproliferative disorder characterized by ectopic myeloid hyperplasia in the spleen and liver. Embryonic p107  $-/-$  fibroblasts and primary myoblasts isolated from adult p107  $-/-$  mice

displayed a striking 2-fold acceleration in doubling time. However, cell sort analysis indicated that the fraction of cells in G1, S, and G2 was unaltered, suggesting that the different phases of the cell cycle in p107  $-/-$  cells was uniformly reduced by a factor of 2. Western analysis of cyclin expression in synchronized p107  $-/-$  fibroblasts revealed that expression of cyclins E and A preceded that of D1. Mutant embryos expressed approximately twice the normal levels of Rb, whereas p130 levels were unaltered. Finally, mutant mice reverted to a wildtype phenotype following a single backcross with C57BL/6J mice, suggesting the existence of modifier genes that have potentially epistatic relationships with p107. LeCouter et al. (1998) concluded that p107 has an important role in negatively regulating the rate of progression of the cell cycle, but in a strain-dependent manner.

[25155] It is appreciated that the abovementioned animal model for RBL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[25156] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [25157] Ewen, M. E.; Xing, Y.; Lawrence, J. B.; Livingston, D. M. : Molecular cloning, chromosomal mapping, and expression of the cDNA for p107, a retinoblastoma gene product-related protein. Cell 66: 1155–1164, 1991. ; and
- [25158] LeCouter, J. E.; Kablar, B.; Hardy, W. R.; Ying, C.; Megeney, L. A.; May, L. L.; Rudnicki, M. A. : Strain-dependent myeloid hyperplasia, growth deficiency, and accelerated cell cycle in.
- [25159] Further studies establishing the function and utilities of RBL1 are found in John Hopkins OMIM database record ID 116957, and in cited publications numbered 12349–4450 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011) is another VGAM592 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15228, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25160] Another function of VGAM592 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM\_014011). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. FLJ23017 (Accession NM\_022840) is another VGAM592 host target gene. FLJ23017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23017 BINDING SITE, designated SEQ ID:23130, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25161] Another function of VGAM592 is therefore inhibition of FLJ23017 (Accession NM\_022840). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23017. KIAA0354 (Accession NM\_014872) is another VGAM592 host target gene. KIAA0354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0354, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0354 BINDING SITE, designated SEQ ID:16997, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25162] Another function of VGAM592 is therefore inhibition of KIAA0354 (Accession NM\_014872). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354. KIAA0472 (Accession XM\_050147) is another VGAM592 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35579, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25163] Another function of VGAM592 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0472. KIAA1297 (Accession XM\_051005) is another VGAM592 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35718, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25164] Another function of VGAM592 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201) is another VGAM592 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ

ID:42793, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25165] Another function of VGAM592 is therefore inhibition of I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM\_114201). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. LEC3 (Accession NM\_015236) is another VGAM592 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17572, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25166] Another function of VGAM592 is therefore inhibition of LEC3 (Accession NM\_015236). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. TUSP (Accession NM\_020245) is another VGAM592 host target gene. TUSP BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21532, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25167] Another function of VGAM592 is therefore inhibition of TUSP (Accession NM\_020245). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC143308 (Accession XM\_096411) is another VGAM592 host target gene. LOC143308 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:40349, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25168] Another function of VGAM592 is therefore inhibition of

LOC143308 (Accession XM\_096411). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308. LOC146136 (Accession XM\_053737) is another VGAM592 host target gene. LOC146136 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146136 BINDING SITE, designated SEQ ID:36111, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25169] Another function of VGAM592 is therefore inhibition of LOC146136 (Accession XM\_053737). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146136. LOC150225 (Accession XM\_097870) is another VGAM592 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41190, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25170] Another function of VGAM592 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC152860 (Accession XM\_087539) is another VGAM592 host target gene. LOC152860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152860 BINDING SITE, designated SEQ ID:39325, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25171] Another function of VGAM592 is therefore inhibition of LOC152860 (Accession XM\_087539). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152860. LOC158301 (Accession XM\_088543) is an-

other VGAM592 host target gene. LOC158301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158301 BINDING SITE, designated SEQ ID:39810, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25172] Another function of VGAM592 is therefore inhibition of LOC158301 (Accession XM\_088543). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158301. LOC220565 (Accession XM\_165417) is another VGAM592 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:43635, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25173] Another function of VGAM592 is therefore inhibition of LOC220565 (Accession XM\_165417). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC221810 (Accession XM\_168222) is another VGAM592 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:45085, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25174] Another function of VGAM592 is therefore inhibition of LOC221810 (Accession XM\_168222). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221810. LOC255158 (Accession XM\_171213) is another VGAM592 host target gene. LOC255158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255158, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255158 BINDING SITE, designated SEQ ID:46001, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25175] Another function of VGAM592 is therefore inhibition of LOC255158 (Accession XM\_171213). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255158. LOC90538 (Accession XM\_032401) is another VGAM592 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90538 BINDING SITE, designated SEQ ID:31657, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25176] Another function of VGAM592 is therefore inhibition of LOC90538 (Accession XM\_032401). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90538. LOC93380 (Accession XM\_051020) is another VGAM592 host target gene. LOC93380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:35726, to the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, also designated SEQ ID:3303.

[25177] Another function of VGAM592 is therefore inhibition of LOC93380 (Accession XM\_051020). Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 593 (VGAM593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25178] VGAM593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM593 was detected is described hereinabove with reference to Figs. 1–8.

[25179] VGAM593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25180] VGAM593 gene encodes a VGAM593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM593 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM593 precursor RNA is designated SEQ ID:579, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:579 is located at position 75792 relative to the genome of Gallid Herpesvirus 2.

[25181] VGAM593 precursor RNA folds onto itself, forming VGAM593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25182] An enzyme complex designated DICER COMPLEX, `dices` the VGAM593 folded precursor RNA into VGAM593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM593 RNA is designated SEQ ID:3304, and is provided hereinbelow with reference to the sequence listing part.

[25183] VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM593 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25184] VGAM593 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM593 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM593 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25185] The complementary binding of VGAM593 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM593 host target RNA into VGAM593 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25186] It is appreciated that VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM593 host target genes. The mRNA of each one of this plurality of VGAM593 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM593 RNA, herein designated VGAM RNA, and which when bound by VGAM593 RNA causes inhibition of translation of respective one or more VGAM593 host target proteins.

[25187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM593 gene, herein designated VGAM GENE, on one or more VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25188] It is yet further appreciated that a function of VGAM593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM593 correlate with, and may be deduced from, the identity of the host target genes which VGAM593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25189] Nucleotide sequences of the VGAM593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM593 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM593 are further described hereinbelow with reference to Table 1.

[25190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM593 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25191] As mentioned hereinabove with reference to Fig. 1, a function of VGAM593 gene, herein designated VGAM is inhibition of expression of VGAM593 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM593 correlate with, and may be deduced from, the identity of the target genes which VGAM593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25192] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM\_005187) is a VGAM593 host target gene. CBFA2T3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11694, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25193] A function of VGAM593 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM\_005187). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. Growth Arrest-specific 11 (GAS11, Accession NM\_001481) is another VGAM593 host target gene. GAS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS11 BINDING SITE, designated SEQ ID:7222, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25194] Another function of VGAM593 is therefore inhibition of Growth Arrest-specific 11 (GAS11, Accession NM\_001481). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS11. Nidogen (enactin) (NID, Accession NM\_002508) is another VGAM593 host target gene. NID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NID BINDING SITE, designated SEQ ID:8341, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25195] Another function of VGAM593 is therefore inhibition of Nidogen (enactin) (NID, Accession NM\_002508). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NID. Nipsnap Homolog 1 (C. elegans) (NIPSNAP1, Accession NM\_003634) is another VGAM593 host target gene. NIPSNAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIPSNAP1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIPSNAP1 BINDING SITE, designated SEQ ID:9703, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25196] Another function of VGAM593 is therefore inhibition of Nipsnap Homolog 1 (*C. elegans*) (NIPSNAP1, Accession NM\_003634). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIPSNAP1. Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838) is another VGAM593 host target gene. UBE3A BINDING SITE1 through UBE3A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE1 through UBE3A BINDING SITE3, designated SEQ ID:28359, SEQ ID:28363 and SEQ ID:6078 respectively, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3304.

[25197] Another function of VGAM593 is therefore inhibition of Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A. KIAA0141 (Accession NM\_014773) is another VGAM593 host target gene. KIAA0141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0141 BINDING SITE, designated SEQ ID:16584, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25198] Another function of VGAM593 is therefore inhibition of KIAA0141 (Accession NM\_014773). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0141. KIAA1550 (Accession XM\_039393) is another VGAM593 host target gene. KIAA1550 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33067, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25199] Another function of VGAM593 is therefore inhibition of KIAA1550 (Accession XM\_039393). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. KIAA1956 (Accession XM\_085836) is another VGAM593 host target gene. KIAA1956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1956 BINDING SITE, designated SEQ ID:38363, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25200] Another function of VGAM593 is therefore inhibition of

KIAA1956 (Accession XM\_085836). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956. MGC17330 (Accession NM\_052880) is another VGAM593 host target gene. MGC17330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC17330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:27458, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25201] Another function of VGAM593 is therefore inhibition of MGC17330 (Accession NM\_052880). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17330. NYD-SP11 (Accession NM\_031951) is another VGAM593 host target gene. NYD-SP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NYD-SP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of NYD-SP11 BINDING SITE, designated SEQ ID:25688, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25202] Another function of VGAM593 is therefore inhibition of NYD-SP11 (Accession NM\_031951). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP11. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119) is another VGAM593 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:43895, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25203] Another function of VGAM593 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM\_166119). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ZNF33A. LOC124602 (Accession XM\_058829) is another VGAM593 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36758, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25204] Another function of VGAM593 is therefore inhibition of LOC124602 (Accession XM\_058829). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC130412 (Accession XM\_065708) is another VGAM593 host target gene. LOC130412 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130412 BINDING SITE, designated SEQ ID:37291, to

the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25205] Another function of VGAM593 is therefore inhibition of LOC130412 (Accession XM\_065708). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130412. LOC203397 (Accession XM\_114695) is another VGAM593 host target gene. LOC203397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203397 BINDING SITE, designated SEQ ID:43038, to the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, also designated SEQ ID:3304.

[25206] Another function of VGAM593 is therefore inhibition of LOC203397 (Accession XM\_114695). Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 594 (VGAM594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25207] VGAM594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM594 was detected is described hereinabove with reference to Figs. 1–8.

[25208] VGAM594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern Cereal Mosaic Virus. VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25209] VGAM594 gene encodes a VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM594 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM594 precursor RNA is designated SEQ ID:580, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:580 is located at position 8565 relative to the genome of Northern Cereal Mosaic Virus.

[25210] VGAM594 precursor RNA folds onto itself, forming VGAM594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25211] An enzyme complex designated DICER COMPLEX, `dices` the VGAM594 folded precursor RNA into VGAM594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM594 RNA is designated SEQ ID:3305, and is provided hereinbelow with reference to the sequence listing part.

[25212] VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM594 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM594 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25213] VGAM594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM594 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25214] The complementary binding of VGAM594 RNA, herein designated VGAM RNA, to host target binding sites on VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM594 host target RNA into VGAM594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25215] It is appreciated that VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM594 host target genes. The mRNA of each one of this plurality of VGAM594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM594 RNA, herein designated VGAM RNA, and which when bound by VGAM594 RNA causes inhibition of translation of respective one or more VGAM594 host target proteins.

[25216] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM594 gene, herein designated VGAM GENE, on one or more VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25217] It is yet further appreciated that a function of VGAM594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of viral infection by Northern Cereal Mosaic Virus. Specific functions, and accordingly utilities, of VGAM594 correlate with, and may be deduced from, the

identity of the host target genes which VGAM594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25218] Nucleotide sequences of the VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM594 are further described hereinbelow with reference to Table 1.

[25219] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM594 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM594 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25220] As mentioned hereinabove with reference to Fig. 1, a function of VGAM594 gene, herein designated VGAM is inhibition of expression of VGAM594 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM594 correlate with, and may be deduced from, the identity of the target genes which VGAM594

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25221] Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM\_020919) is a VGAM594 host target gene. ALS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2 BINDING SITE, designated SEQ ID:21931, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25222] A function of VGAM594 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM\_020919). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2. HTRA3 (Accession XM\_114416) is another VGAM594 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of HTRA3 BINDING SITE, designated SEQ ID:42942, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25223] Another function of VGAM594 is therefore inhibition of HTRA3 (Accession XM\_114416). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM\_003679) is another VGAM594 host target gene. KMO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:9780, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25224] Another function of VGAM594 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM\_003679), a gene which may play a role in encephalic photoreception. Ac-

cordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO. The function of KMO and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM162. Laminin, Alpha 4 (LAMA4, Accession NM\_002290) is another VGAM594 host target gene. LAMA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAMA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMA4 BINDING SITE, designated SEQ ID:8070, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25225] Another function of VGAM594 is therefore inhibition of Laminin, Alpha 4 (LAMA4, Accession NM\_002290), a gene which mediates the attachment, migration and organization of cells into tissues. Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMA4. The function of LAMA4 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM300. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842) is another VGAM594 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9942, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25226] Another function of VGAM594 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM\_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. Wingless-type MMTV Integra-

tion Site Family, Member 10B (WNT10B, Accession NM\_003394) is another VGAM594 host target gene. WNT10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT10B BINDING SITE, designated SEQ ID:9432, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25227] Another function of VGAM594 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 10B (WNT10B, Accession NM\_003394), a gene which is a ligand for members of the frizzled family of seven trans-membrane receptors and may be a signaling molecule. Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT10B. The function of WNT10B has been established by previous studies. Several members of the Wnt gene family have been shown to cause mammary tumors in mice. Using degenerate primer PCR on human genomic DNA and specific PCR of cDNA libraries, Bui et al.

(1997) isolated a Wnt gene that had not previously been described in human. It is the human homolog of mouse Wnt10b, which had been shown to be one of the oncogenes cooperating with FGF3 (OMIM Ref. No. 164950) in the development of mouse mammary tumor virus (MMTV)–induced mammary carcinomas in mice. The human WNT10B sequence is 88 and 95% identical to the murine gene at nucleotide and amino acid levels, respectively. By YAC and fluorescence in situ hybridization (FISH) mapping, Bui et al. (1997) localized the gene to 12q13, a chromosomal region frequently rearranged in human tumors and also containing the WNT1 gene (OMIM Ref. No. 164820). WNT10B expression was not observed in normal and benign proliferations of human breast tissue but was found to be elevated in 3 of 50 primary breast carcinomas. Southern blot analysis of the carcinoma expressing the highest level of WNT10B showed no amplification or rearrangement of the gene. Hardiman et al. (1997) demonstrated that the WNT10B gene encodes a 389–amino acid protein with 96.6% sequence identity to mouse Wnt10b. The expression pattern showed that it is synthesized in many adult tissues with the highest levels found in heart and skeletal muscle. Ross et al. (2000)

showed that WNT signaling, likely mediated by WNT10B, is a molecular switch that governs adipogenesis. WNT signaling maintains preadipocytes in an undifferentiated state through inhibition of the adipogenic transcription factors CEBPA (OMIM Ref. No. 116897) and PPAR-gamma (OMIM Ref. No. 601487). When WNT signaling in preadipocytes is prevented by overexpression of axin (OMIM Ref. No. 603816) or dominant-negative TCF4 (OMIM Ref. No. 602272), these cells differentiate into adipocytes. Disruption of WNT signaling also causes transdifferentiation of myoblasts into adipocytes in vitro, highlighting the importance of this pathway not only in adipocyte differentiation but also in mesodermal cell fate determination. By PCR typing of a human/rodent monochromosomal panel and FISH, Hardiman et al. (1997) mapped the WNT10B gene to chromosome 12q13.1. By analyzing human genome draft sequence, Kirikoshi et al. (2001) determined that WNT10B is encoded by 5 exons and is clustered with WNT1 (OMIM Ref. No. 164820) in a head-to-head manner with an interval of less than 7 kb. They hypothesized that the WNT1-WNT10B gene cluster and the WNT6 (OMIM Ref. No. 604663)-WNT10A (OMIM Ref. No. 606268) gene cluster on chromosome 2 might be

due to duplication of an ancestral WNT gene cluster.

[25228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25229] Kirikoshi, H.; Sekihara, H.; Katoh, M. : WNT10A and WNT6, clustered in human chromosome 2q35 region with head-to-tail manner, are strongly coexpressed in SW480 cells. *Biochem. Biophys. Res. Commun.* 283: 798–805, 2001. ; and

[25230] Ross, S. E.; Hemati, N.; Longo, K. A.; Bennett, C. N.; Lucas, P. C.; Erickson, R. L.; MacDougald, O. A. : Inhibition of adipogenesis by Wnt signaling. *Science* 289: 950–953, 2000.

[25231] Further studies establishing the function and utilities of WNT10B are found in John Hopkins OMIM database record ID 601906, and in cited publications numbered 8886–888 and 12748 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332) is another VGAM594 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27176, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25232] Another function of VGAM594 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. CSRP2 Binding Protein (CSRP2BP, Accession XM\_046520) is another VGAM594 host target gene. CSRP2BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSRP2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP2BP BINDING SITE, designated SEQ ID:34737, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25233] Another function of VGAM594 is therefore inhibition of CSRP2 Binding Protein (CSRP2BP, Accession XM\_046520).

Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP2BP. DKFZP434D146 (Accession NM\_015595) is another VGAM594 host target gene. DKFZP434D146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434D146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:17874, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25234] Another function of VGAM594 is therefore inhibition of DKFZP434D146 (Accession NM\_015595). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D146. KIAA0435 (Accession NM\_014801) is another VGAM594 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16726, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25235] Another function of VGAM594 is therefore inhibition of KIAA0435 (Accession NM\_014801). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435. KIAA0444 (Accession XM\_030999) is another VGAM594 host target gene. KIAA0444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0444 BINDING SITE, designated SEQ ID:31247, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25236] Another function of VGAM594 is therefore inhibition of KIAA0444 (Accession XM\_030999). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0444. KIAA0563 (Accession NM\_014834) is another

VGAM594 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16845, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25237] Another function of VGAM594 is therefore inhibition of KIAA0563 (Accession NM\_014834). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759) is another VGAM594 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:16512, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3305.

[25238] Another function of VGAM594 is therefore inhibition of Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP. PRO1843 (Accession NM\_018507) is another VGAM594 host target gene. PRO1843 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1843 BINDING SITE, designated SEQ ID:20574, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25239] Another function of VGAM594 is therefore inhibition of PRO1843 (Accession NM\_018507). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1843. RIL (Accession NM\_003687) is another VGAM594 host target gene. RIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

RIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIL BINDING SITE, designated SEQ ID:9798, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25240] Another function of VGAM594 is therefore inhibition of RIL (Accession NM\_003687). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIL. TUSP (Accession NM\_020245) is another VGAM594 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21536, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25241] Another function of VGAM594 is therefore inhibition of TUSP (Accession NM\_020245). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP.

LOC144845 (Accession NM\_138474) is another VGAM594 host target gene. LOC144845 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144845 BINDING SITE, designated SEQ ID:28823, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25242] Another function of VGAM594 is therefore inhibition of LOC144845 (Accession NM\_138474). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144845. LOC150290 (Accession XM\_086863) is another VGAM594 host target gene. LOC150290 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150290 BINDING SITE, designated SEQ ID:38934, to the nucleotide sequence of VGAM594 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3305.

[25243] Another function of VGAM594 is therefore inhibition of LOC150290 (Accession XM\_086863). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150290. LOC254423 (Accession XM\_173286) is another VGAM594 host target gene. LOC254423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254423 BINDING SITE, designated SEQ ID:46531, to the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, also designated SEQ ID:3305.

[25244] Another function of VGAM594 is therefore inhibition of LOC254423 (Accession XM\_173286). Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254423. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 595 (VGAM595) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25245] VGAM595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM595 was detected is described hereinabove with reference to Figs. 1–8.

[25246] VGAM595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern Cereal Mosaic Virus. VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25247] VGAM595 gene encodes a VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM595 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM595 precursor RNA is designated SEQ ID:581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:581 is located at position 9694 relative to the genome of Northern Cereal Mosaic Virus.

[25248] VGAM595 precursor RNA folds onto itself, forming

VGAM595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25249] An enzyme complex designated DICER COMPLEX, `dices` the VGAM595 folded precursor RNA into VGAM595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM595 RNA is designated SEQ ID:3306, and is provided hereinbelow with reference to the sequence listing part.

[25250] VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM595 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25251] VGAM595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM595 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25252] The complementary binding of VGAM595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM595 host target RNA into VGAM595 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25253] It is appreciated that VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM595 host target genes. The mRNA of each one of this plurality of VGAM595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM595 RNA, herein designated VGAM RNA, and which when bound by VGAM595 RNA causes inhibition of translation of respective one or more VGAM595 host target proteins.

[25254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM595 gene, herein designated VGAM GENE, on one or more VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25255] It is yet further appreciated that a function of VGAM595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of viral infection by Northern Cereal Mosaic Virus. Specific functions, and accordingly utilities, of VGAM595 correlate with, and may be deduced from, the identity of the host target genes which VGAM595 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25256] Nucleotide sequences of the VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM595 are further described hereinbelow with reference to Table 1.

[25257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM595 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25258] As mentioned hereinabove with reference to Fig. 1, a function of VGAM595 gene, herein designated VGAM is inhibition of expression of VGAM595 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM595 correlate with, and may be deduced from, the identity of the target genes which VGAM595 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[25259] ATP-binding Cassette, Sub-family G (WHITE), Member 1 (ABCG1, Accession NM\_004915) is a VGAM595 host target gene. ABCG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCG1 BINDING SITE, designated SEQ ID:11352, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25260] A function of VGAM595 is therefore inhibition of ATP-binding Cassette, Sub-family G (WHITE), Member 1 (ABCG1, Accession NM\_004915), a gene which transporter involved in macrophage lipid homeostasis. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCG1. The function of ABCG1 has been established by previous studies. In *Drosophila*, the 'White' (W), 'Scarlet' (St), and 'Brown' (Bw) proteins are members of the ATP-binding cassette (ABC) transporter superfamily of trans-membrane permeases and are involved in transporting

precursors of eye pigments. See 601691. A functional ABC transporter unit contains 2 nucleotide-binding domains and 2 hydrophobic domains. The W, Bw, and St proteins contain only 1 of each domain, and so W is thought to form heterodimers with St or Bw to assemble functional transporters. Using RACE assays, Lorkowski et al. (2001) determined that the ABCG1 gene contains 5 exons more than what was previously reported, 4 upstream and 1 downstream of the previous exon 1, and spans 97 kb. The novel exons are predicted to encode at least 5 novel transcripts. Additional promoter regions were identified upstream of exons 1 and 5, respectively. The first promoter contains putative SP1 (OMIM Ref. No. 189906) and nuclear factor kappa-B (see OMIM Ref. No. 164011) binding sites, but no sterol response elements or retinoid X receptor (see OMIM Ref. No. 180245) binding sites. The second promoter contains all 4 of these binding-site types. Both promoters, however, were found to be responsive in macrophages to hydroxycholesterol and retinoic acid. Chen et al. (1996) reported a DNA polymorphism with 62% heterozygosity due to variation of a poly(T) region in the 3-prime untranslated region of hW. Croop et al. (1997) identified a polymorphic (CA)<sub>n</sub> repeat that is either intra-

genic or within 20 kb of the 3-prime end of hW. By analysis of somatic cell hybrids and by linkage analysis, Chen et al. (1996) mapped the hW gene to 21q22.3. This assignment was confirmed by Croop et al. (1997) using fluorescence in situ hybridization and by Savary et al. (1996) using in situ hybridization. By in situ hybridization, Savary et al. (1996) mapped the ABC8 gene to mouse chromosome 17, region A2-B, a region that shows homology of synteny with human chromosome 21q22.2-q22.3.

[25261] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25262] Chen, H.; Rossier, C.; Lalioti, M. D.; Lynn, A.; Chakravarti, A.; Perrin, G.; Antonarakis, S. E. : Cloning of the cDNA for a human homologue of the *Drosophila* white gene and mapping to chromosome 21q22.3. *Am. J. Hum. Genet.* 59: 66-75, 1996. ; and

[25263] Lorkowski, S.; Rust, S.; Engel, T.; Jung, E.; Tegelkamp, K.; Galinski, E. A.; Assmann, G.; Cullen, P. : Genomic sequence and structure of the human ABCG1 (ABC8) gene. *Biochem. Biophys. R.*

[25264] Further studies establishing the function and utilities of ABCG1 are found in John Hopkins OMIM database record

ID 603076, and in cited publications numbered 1062–1067 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adenosine A1 Receptor (ADORA1, Accession NM\_000674) is another VGAM595 host target gene. ADORA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADORA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADORA1 BINDING SITE, designated SEQ ID:6330, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25265] Another function of VGAM595 is therefore inhibition of Adenosine A1 Receptor (ADORA1, Accession NM\_000674), a gene which the activity of this receptor is mediated by G proteins which inhibit adenylyl cyclase. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA1. The function of ADORA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM234.CD28 Antigen (Tp44) (CD28, Accession NM\_006139) is another VGAM595 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12783, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25266] Another function of VGAM595 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM\_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281.Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786) is another VGAM595 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CIT, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34565, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25267] Another function of VGAM595 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393.Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921) is another VGAM595 host target gene. CLCA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CLCA3 BINDING SITE, designated SEQ ID:11356, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25268] Another function of VGAM595 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921), a gene which is similar to calcium-activated chloride channel family. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCA3. The function of CLCA3 has been established by previous studies. Members of the CLCA family of calcium-activated chloride channels, such as human CLCA1 (OMIM Ref. No. 603906) and bovine lung-endothelial cell adhesion molecule-1 (Lu-ECAM-1), are translated as approximately 125-kD proteins that are cleaved to form transmembrane heterodimers consisting of approximately 90- and 35-kD polypeptides. See CLCA1 for additional information on the CLCA family. By screening a human spleen cDNA library with a Lu-ECAM-1 cDNA and by RACE, Gruber and Pauli (1999) isolated a 3.6-kb cDNA encoding CLCA3. The CLCA3 cDNA is similar in length and sequence to the cDNAs of previously cloned family mem-

bers. However, unlike all previously known CLCA cDNAs, the CLCA3 cDNA does not have a long open reading frame (ORF), but instead contains 2 smaller ORFs. The authors demonstrated that only 1 of these ORFs is of biologic significance and that it is expressed in mammalian cells as a secreted 37-kD glycoprotein. The deduced 262-amino acid CLCA3 protein corresponds to the N-terminal extracellular domain of other family members. RT-PCR detected CLCA3 expression in all human tissues examined. Gruber and Pauli (1999) verified the sequence of the spleen CLCA3 cDNA by isolating and sequencing a CLCA3 cDNA from human trachea. They concluded that CLCA3 is a structurally divergent member of the CLCA family and that it does not function as a channel protein.

[25269] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25270] Gruber, A. D.; Pauli, B. U. : Clustering of the human CLCA gene family on the short arm of chromosome 1 (1p22-31). *Genome* 42: 1030-1032, 1999. ; and

[25271] Gruber, A. D.; Pauli, B. U. : Molecular cloning and biochemical characterization of a truncated, secreted member of the human family of  $\text{Ca}^{2+}$ -activated  $\text{Cl}^-$  channels.

[25272] Further studies establishing the function and utilities of CLCA3 are found in John Hopkins OMIM database record ID 604337, and in cited publications numbered 7393 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_031226) is another VGAM595 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:25268 and SEQ ID:5558 respectively, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25273] Another function of VGAM595 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_031226), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM595 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM508. MDM1 (Accession NM\_020128) is another VGAM595 host target gene.

MDM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDM1 BINDING SITE, designated SEQ ID:21321, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25274] Another function of VGAM595 is therefore inhibition of MDM1 (Accession NM\_020128). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDM1. Nuclear RNA Export Factor 2 (NXF2, Accession NM\_017809) is another VGAM595 host target gene. NXF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NXF2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE, designated SEQ ID:19459, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25275] Another function of VGAM595 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM\_017809), a gene which is involved in the export of mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 has been established by previous studies. By searching EST databases for homologs of NXF1 and by RT-PCR analysis, Herold et al. (2000) obtained cDNAs encoding NXF2, NXF3 (OMIM Ref. No. 300316), NXF4 (OMIM Ref. No. 300318), and NXF5 (OMIM Ref. No. 300319). The deduced 626-amino acid NXF2 protein has the conserved domain structure of NXF1, including a noncanonical RNP-type RNA-binding domain (RBD), 4 leucine-rich repeats (LRRs), a nuclear transport factor-2 (NTF2; 605813)-like domain that allows heterodimerization with NTF2-related export pro-

tein-1 (NXT1; 605811), and a ubiquitin-associated domain that mediates interactions with nucleoporins. Binding analysis showed that NXF1, NXF2, and NXF3 interact with E1BAP5 (OMIM Ref. No. 605800), as well as with NXT1 and NXT2 (OMIM Ref. No. 300320). The RBDs of NXF1 and NXF2, but not that of NXF3, were found to bind RNA. Only NXF1, however, could promote RNA export mediated by the constitutive transport element of simian type D retrovirus. Both NXF1 and NXF2, but not NXF3, through their C-terminal NWD loop, could bind to the nucleoporins CAN (NUP214; 114350), NUP153 (OMIM Ref. No. 603948), and NUP62 (OMIM Ref. No. 605815). Only NXF1 could bind to NUP98 (OMIM Ref. No. 601021). Fluorescence microscopy demonstrated expression of NXF2 in the nucleoplasm and the nuclear envelope, but it was excluded from the nucleolus. CAT reporter and Western blot assays showed that coexpression of NXF1 or NXF2, but not NXF3, with NXT1 or NXT2 activated CAT expression, suggesting that under these conditions NXF2 can stimulate RNA export. The LRRs and NTF2-like domains are required for export activity. By cDNA subtraction of mouse somatic tissue cDNA from spermatogonia cDNA, database searching, and screening a testis cDNA library, Wang et al.

(2001) also identified NXF2.

[25276] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25277] Herold, A.; Suyama, M.; Rodrigues, J. P.; Braun, I. C.; Kutay, U.; Carmo-Fonseca, M.; Bork, P.; Izaurralde, E. : TAP (NXF1) belongs to a multigene family of putative RNA export factors with a conserved modular architecture. *Molec. Cell. Biol.* 20: 8996–9008, 2000. ; and

[25278] Wang, P. J.; McCarrey, J. R.; Yang, F.; Page, D. C. : An abundance of X-linked genes expressed in spermatogonia. *Nature Genet.* 27: 422–426, 2001.

[25279] Further studies establishing the function and utilities of NXF2 are found in John Hopkins OMIM database record ID 300315, and in cited publications numbered 9444 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BH-protocadherin (brain-heart) (PCDH7, Accession NM\_032456) is another VGAM595 host target gene. PCDH7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PCDH7 BINDING SITE, designated SEQ ID:26218, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25280] Another function of VGAM595 is therefore inhibition of BH-protocadherin (brain-heart) (PCDH7, Accession NM\_032456). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7. RAD54B (Accession NM\_134434) is another VGAM595 host target gene. RAD54B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAD54B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD54B BINDING SITE, designated SEQ ID:28678, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25281] Another function of VGAM595 is therefore inhibition of RAD54B (Accession NM\_134434), a gene which is involved in dna repair and mitotic recombination. Accordingly, utilities of VGAM595 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with RAD54B. The function of RAD54B has been established by previous studies. RAD54B, a member of the SNF2/SWI2 superfamily (see OMIM Ref. No. 600014), is part of a complex involved in the recombinational repair of DNA damage. Hiramoto et al. (1999) described the isolation of a member of the SNF2 superfamily characterized by sequence motifs similar to those in DNA and RNA helicases. The gene, designated RAD54B, shows significant homology to the RAD54 gene (OMIM Ref. No. 603615). The RAD54B cDNA was predicted to encode a protein of 910 amino acids. Northern blot analysis detected a 3.2-kb transcript highly expressed in testis and spleen, which are active in meiotic and mitotic recombination.

[25282] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25283] Hiramoto, T.; Nakanishi, T.; Sumiyoshi, T.; Fukuda, T.; Matsuura, S.; Tauchi, H.; Komatsu, K.; Shibasaki, Y.; Inui, H.; Watatani, M.; Yasutomi, M.; Sumii, K.; Kajiyama, G.; Kamada, N.; Miyagawa, K.; Kamiya, K. : Mutations of a novel human RAD54 homologue, RAD54B, in primary cancer. *Oncogene* 18: 3422–3426, 1999. ; and

[25284] Miyagawa, K.; Tsuruga, T.; Kinomura, A.; Usui, K.; Katsura, M.; Tashiro, S.; Mishima, H.; Tanaka, K. : A role for RAD54B in homologous recombination in human cells. EMBO J. 21: 175–180.

[25285] Further studies establishing the function and utilities of RAD54B are found in John Hopkins OMIM database record ID 604289, and in cited publications numbered 1102–1104 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM\_006931) is another VGAM595 host target gene. SLC2A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A3 BINDING SITE, designated SEQ ID:13814, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25286] Another function of VGAM595 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM\_006931), a gene which

probably is a neuronal glucose transporter. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A3. The function of SLC2A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471) is another VGAM595 host target gene. TRPC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ ID:14850, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25287] Another function of VGAM595 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with TRPC5. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_007331) is another VGAM595 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:14250, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25288] Another function of VGAM595 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM\_007331), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.AAK1 (Accession NM\_014911) is another VGAM595 host target gene. AAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by AAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAK1 BINDING SITE, designated SEQ ID:17145, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25289] Another function of VGAM595 is therefore inhibition of AAK1 (Accession NM\_014911). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAK1. AF020591 (Accession NM\_014480) is another VGAM595 host target gene. AF020591 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AF020591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF020591 BINDING SITE, designated SEQ ID:15825, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25290] Another function of VGAM595 is therefore inhibition of AF020591 (Accession NM\_014480). Accordingly, utilities

of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF020591. Bifunctional Apoptosis Regulator (BFAR, Accession XM\_027311) is another VGAM595 host target gene. BFAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BFAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BFAR BINDING SITE, designated SEQ ID:30480, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25291] Another function of VGAM595 is therefore inhibition of Bifunctional Apoptosis Regulator (BFAR, Accession XM\_027311). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BFAR. Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM\_030944) is another VGAM595 host target gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:25215, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25292] Another function of VGAM595 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM\_030944). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. CED-6 (Accession NM\_016315) is another VGAM595 host target gene. CED-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18434, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25293] Another function of VGAM595 is therefore inhibition of CED-6 (Accession NM\_016315). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6.

DKFZP761C169 (Accession XM\_042059) is another VGAM595 host target gene. DKFZP761C169 BINDING SITE1 and DKFZP761C169 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP761C169, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761C169 BINDING SITE1 and DKFZP761C169 BINDING SITE2, designated SEQ ID:33677 and SEQ ID:33678 respectively, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25294] Another function of VGAM595 is therefore inhibition of DKFZP761C169 (Accession XM\_042059). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761C169. FLJ10956 (Accession NM\_018283) is another VGAM595 host target gene. FLJ10956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10956 BINDING SITE, designated SEQ ID:20278, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25295] Another function of VGAM595 is therefore inhibition of FLJ10956 (Accession NM\_018283). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. FLJ11125 (Accession XM\_005318) is another VGAM595 host target gene. FLJ11125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11125 BINDING SITE, designated SEQ ID:29978, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25296] Another function of VGAM595 is therefore inhibition of FLJ11125 (Accession XM\_005318). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11125. FLJ20294 (Accession NM\_017749) is another VGAM595 host target gene. FLJ20294 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19352, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25297] Another function of VGAM595 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ21034 (Accession NM\_024940) is another VGAM595 host target gene. FLJ21034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21034 BINDING SITE, designated SEQ ID:24484, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25298] Another function of VGAM595 is therefore inhibition of

FLJ21034 (Accession NM\_024940). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21034. FLJ23584 (Accession NM\_024588) is another VGAM595 host target gene. FLJ23584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23584 BINDING SITE, designated SEQ ID:23823, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25299] Another function of VGAM595 is therefore inhibition of FLJ23584 (Accession NM\_024588). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23584. FLJ30213 (Accession NM\_145008) is another VGAM595 host target gene. FLJ30213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ30213 BINDING SITE, designated SEQ ID:29609, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25300] Another function of VGAM595 is therefore inhibition of FLJ30213 (Accession NM\_145008). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30213. KIAA0089 (Accession XM\_046056) is another VGAM595 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34670, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25301] Another function of VGAM595 is therefore inhibition of KIAA0089 (Accession XM\_046056). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA1155 (Accession XM\_030864) is another

VGAM595 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31201, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25302] Another function of VGAM595 is therefore inhibition of KIAA1155 (Accession XM\_030864). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. KIAA1276 (Accession XM\_039169) is another VGAM595 host target gene. KIAA1276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1276 BINDING SITE, designated SEQ ID:33020, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25303] Another function of VGAM595 is therefore inhibition of KIAA1276 (Accession XM\_039169). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1276. KIAA1712 (Accession XM\_041497) is another VGAM595 host target gene. KIAA1712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33540, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25304] Another function of VGAM595 is therefore inhibition of KIAA1712 (Accession XM\_041497). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. KIAA1775 (Accession NM\_033100) is another VGAM595 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26945, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25305] Another function of VGAM595 is therefore inhibition of KIAA1775 (Accession NM\_033100). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. MSP (Accession NM\_032046) is another VGAM595 host target gene. MSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSP BINDING SITE, designated SEQ ID:25762, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25306] Another function of VGAM595 is therefore inhibition of MSP (Accession NM\_032046). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSP. My-

ozenin 2 (MYOZ2, Accession NM\_016599) is another VGAM595 host target gene. MYOZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYOZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOZ2 BINDING SITE, designated SEQ ID:18694, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25307] Another function of VGAM595 is therefore inhibition of Myozenin 2 (MYOZ2, Accession NM\_016599). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOZ2. P21 (CDKN1A)-activated Kinase 2 (PAK2, Accession XM\_039354) is another VGAM595 host target gene. PAK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK2 BINDING SITE, designated SEQ ID:33063, to the nucleotide sequence of VGAM595 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3306.

[25308] Another function of VGAM595 is therefore inhibition of P21 (CDKN1A)–activated Kinase 2 (PAK2, Accession XM\_039354). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK2. PRO1430 (Accession NM\_018599) is another VGAM595 host target gene. PRO1430 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1430 BINDING SITE, designated SEQ ID:20678, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25309] Another function of VGAM595 is therefore inhibition of PRO1430 (Accession NM\_018599). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1430. Sialyltransferase 4A (beta–galactoside alpha–2,3–sialyltransferase) (SIAT4A, Accession NM\_003033) is another VGAM595 host target gene. SIAT4A BINDING SITE

is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIAT4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4A BINDING SITE, designated SEQ ID:8982, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25310] Another function of VGAM595 is therefore inhibition of Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM\_003033). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4A. TOPBP1 (Accession NM\_007027) is another VGAM595 host target gene. TOPBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TOPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOPBP1 BINDING SITE, designated SEQ ID:13888, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25311] Another function of VGAM595 is therefore inhibition of TOPBP1 (Accession NM\_007027). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPBP1. LOC126603 (Accession XM\_060090) is another VGAM595 host target gene. LOC126603 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126603 BINDING SITE, designated SEQ ID:37152, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25312] Another function of VGAM595 is therefore inhibition of LOC126603 (Accession XM\_060090). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126603. LOC129676 (Accession XM\_065341) is another VGAM595 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37289, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25313] Another function of VGAM595 is therefore inhibition of LOC129676 (Accession XM\_065341). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC143914 (Accession XM\_084654) is another VGAM595 host target gene. LOC143914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143914 BINDING SITE, designated SEQ ID:37637, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25314] Another function of VGAM595 is therefore inhibition of LOC143914 (Accession XM\_084654). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143914. LOC144195 (Accession XM\_016498) is another VGAM595 host target gene. LOC144195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144195 BINDING SITE, designated SEQ ID:30264, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25315] Another function of VGAM595 is therefore inhibition of LOC144195 (Accession XM\_016498). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144195. LOC149707 (Accession XM\_086641) is another VGAM595 host target gene. LOC149707 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149707 BINDING SITE, designated SEQ ID:38803, to the nucleotide sequence of VGAM595 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3306.

[25316] Another function of VGAM595 is therefore inhibition of LOC149707 (Accession XM\_086641). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149707. LOC150848 (Accession XM\_097959) is another VGAM595 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41252, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25317] Another function of VGAM595 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC150960 (Accession XM\_087059) is another VGAM595 host target gene. LOC150960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150960, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150960 BINDING SITE, designated SEQ ID:39032, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25318] Another function of VGAM595 is therefore inhibition of LOC150960 (Accession XM\_087059). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150960. LOC154789 (Accession XM\_088043) is another VGAM595 host target gene. LOC154789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154789 BINDING SITE, designated SEQ ID:39488, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25319] Another function of VGAM595 is therefore inhibition of LOC154789 (Accession XM\_088043). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC154789. LOC157226 (Accession XM\_033876) is another VGAM595 host target gene. LOC157226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31979, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25320] Another function of VGAM595 is therefore inhibition of LOC157226 (Accession XM\_033876). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. LOC158062 (Accession XM\_098861) is another VGAM595 host target gene. LOC158062 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158062 BINDING SITE, designated SEQ ID:41916, to

the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25321] Another function of VGAM595 is therefore inhibition of LOC158062 (Accession XM\_098861). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158062. LOC200227 (Accession XM\_114162) is another VGAM595 host target gene. LOC200227 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200227 BINDING SITE, designated SEQ ID:42748, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25322] Another function of VGAM595 is therefore inhibition of LOC200227 (Accession XM\_114162). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200227. LOC200273 (Accession XM\_047698) is another VGAM595 host target gene. LOC200273 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC200273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200273 BINDING SITE, designated SEQ ID:35029, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25323] Another function of VGAM595 is therefore inhibition of LOC200273 (Accession XM\_047698). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200273. LOC256529 (Accession XM\_174314) is another VGAM595 host target gene. LOC256529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256529 BINDING SITE, designated SEQ ID:46590, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25324] Another function of VGAM595 is therefore inhibition of LOC256529 (Accession XM\_174314). Accordingly, utilities

of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256529. LOC51068 (Accession NM\_015938) is another VGAM595 host target gene. LOC51068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51068 BINDING SITE, designated SEQ ID:18057, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25325] Another function of VGAM595 is therefore inhibition of LOC51068 (Accession NM\_015938). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51068. LOC91496 (Accession XM\_038788) is another VGAM595 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91496 BINDING SITE, designated SEQ ID:32914, to the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, also designated SEQ ID:3306.

[25326] Another function of VGAM595 is therefore inhibition of LOC91496 (Accession XM\_038788). Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 596 (VGAM596) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25327] VGAM596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM596 was detected is described hereinabove with reference to Figs. 1–8.

[25328] VGAM596 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern Cereal Mosaic Virus. VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25329] VGAM596 gene encodes a VGAM596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM596 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM596 precursor RNA is designated SEQ ID:582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:582 is located at position 12057 relative to the genome of Northern Cereal Mosaic Virus.

[25330] VGAM596 precursor RNA folds onto itself, forming VGAM596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25331] An enzyme complex designated DICER COMPLEX, `dices` the VGAM596 folded precursor RNA into VGAM596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM596 RNA is designated SEQ ID:3307, and is provided hereinbelow with reference to the sequence listing part.

[25332] VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM596 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25333] VGAM596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM596 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25334] The complementary binding of VGAM596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM596 host target RNA into VGAM596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25335] It is appreciated that VGAM596 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM596 host target genes. The mRNA of each one of this plurality of VGAM596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM596 RNA, herein designated VGAM RNA, and which when bound by VGAM596 RNA causes inhibition of translation of respective one or more VGAM596 host target proteins.

[25336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM596 gene, herein designated VGAM GENE, on one or more VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[25337] It is yet further appreciated that a function of VGAM596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of viral infection by Northern Cereal Mosaic Virus. Specific functions, and accordingly utilities, of VGAM596 correlate with, and may be deduced from, the identity of the host target genes which VGAM596 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25338] Nucleotide sequences of the VGAM596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM596 are further described hereinbelow with reference to Table 1.

[25339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM596 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25340] As mentioned hereinabove with reference to Fig. 1, a function of VGAM596 gene, herein designated VGAM is inhibition of expression of VGAM596 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM596 correlate with, and may be deduced from, the identity of the target genes which VGAM596 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25341] Carboxypeptidase D (CPD, Accession NM\_001304) is a VGAM596 host target gene. CPD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPD BINDING SITE, designated SEQ ID:6983, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25342] A function of VGAM596 is therefore inhibition of Car-

boxypeptidase D (CPD, Accession NM\_001304), a gene which is a membrane-bound metalloprotease. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPD. The function of CPD has been established by previous studies. The metallocarboxypeptidase family of enzymes is divided into 2 subfamilies based on sequence similarities. The pancreatic carboxypeptidase-like class includes carboxypeptidase A (OMIM Ref. No. 114850), carboxypeptidase B (OMIM Ref. No. 114852), CPA3 (OMIM Ref. No. 114851) and CPB2 (OMIM Ref. No. 603101). The regulatory B-type carboxypeptidase subfamily includes carboxypeptidase N (OMIM Ref. No. 603103), CPM (OMIM Ref. No. 114860), CPE, or H (OMIM Ref. No. 114855), and AEBP1 (OMIM Ref. No. 602981). In membrane fractions of mammalian cells, McGwire et al. (1997) identified a novel regulatory B-type carboxypeptidase that they designated carboxypeptidase D, or CPD. CPD is homologous to duck gp180, a hepatitis B virus-binding protein. By carrying out BLAST searches to identify human homologs of gp180, Tan et al. (1997) isolated cDNAs encoding CPD. The predicted 1,377-amino acid protein contains a signal sequence, 3 tandem carboxypepti-

dase homology domains, and a C-terminal putative trans-membrane domain. The 3 carboxypeptidase domains have sequence similarity to the regulatory B-type carboxypeptidase family. Overall, the amino acid sequences of CPD and gp180 are 75% identical. Northern blot analysis revealed CPD expression as multiple mRNAs in pancreas, placenta, heart, and skeletal muscle. By analysis of somatic cell hybrid panels, Riley et al. (1998) mapped the CPD gene to the centromeric region 17p11.1-q11.2.

[25343] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25344] McGwire, G. B.; Tan, F.; Michel, B.; Rehli, M.; Skidgel, R. A. : Identification of a membrane-bound carboxypeptidase as the mammalian homolog of duck gp180, a hepatitis B virus-binding protein. Life Sci. 60: 715-724, 1997. ; and

[25345] Riley, D. A.; Tan, F.; Miletich, D. J.; Skidgel, R. A. : Chromosomal localization of the genes for human carboxypeptidase D (CPD) and the active 50-kilodalton subunit of human carboxypep.

[25346] Further studies establishing the function and utilities of CPD are found in John Hopkins OMIM database record ID 603102, and in cited publications numbered 8489-8491

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423) is another VGAM596 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10689, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25347] Another function of VGAM596 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Reticulon 3 (RTN3, Accession XM\_058207) is another VGAM596 host target gene. RTN3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by RTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN3 BINDING SITE, designated SEQ ID:36584, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25348] Another function of VGAM596 is therefore inhibition of Reticulon 3 (RTN3, Accession XM\_058207), a gene which is a member of the reticulon (neuroendocrine-specific, NSP) family. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN3. The function of RTN3 has been established by previous studies. The reticulons are a group of highly conserved genes with preferential expression in neuroendocrine tissues. During a subtraction cloning between macula and peripheral retina, Moreira et al. (1999) isolated a novel member of the reticulon gene family, which they designated reticulon-3. The mRNA for RTN3 was approximately 3-fold more abundant in macula than in peripheral retina. The 2,527-bp cDNA encodes a predicted 236-amino acid protein that shows strong sequence similarity with other members of the RTN

gene family (see, OMIM Ref. No., e.g., 600865). Northern blot analysis showed that RTN3 is widely expressed in human tissues, with highest expression in the brain. The RTN3 gene contains 7 exons and spans more than 15 kb. By use of somatic cell hybrid and radiation hybrid panels, Moreira et al. (1999) mapped the RTN3 gene to 11q13, between markers D11S4535 and D11S4627. Southern blot analysis identified the presence of at least one pseudo-gene that was subsequently localized to chromosome 4

[25349] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25350] Moreira, E. F.; Jaworski, C. J.; Rodriguez, I. R. : Cloning of a novel member of the reticulon gene family (RTN3): gene structure and chromosomal localization to 11q13. *Genomics* 58: 73–81, 1999. ; and

[25351] Moreira, E. F.; Jaworski, C. J.; Rodriguez, I. R. : Cloning of a novel member of the reticulon gene family (RTN3): gene structure and chromosomal localization to 11q13. *Genomics* 58: 73–81.

[25352] Further studies establishing the function and utilities of RTN3 are found in John Hopkins OMIM database record ID 604249, and in cited publications numbered 692 listed in

the bibliography section hereinbelow, which are also hereby incorporated by reference. TEM6 (Accession NM\_022748) is another VGAM596 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22964, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25353] Another function of VGAM596 is therefore inhibition of TEM6 (Accession NM\_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736) is another VGAM596 host target gene. XPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by XPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPR1 BINDING SITE, designated SEQ ID:11123, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25354] Another function of VGAM596 is therefore inhibition of Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736), a gene which is a putative G protein-coupled receptor and a target for xenotropic and polytropic murine leukemia retroviruses. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPR1. The function of XPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.MGC29898 (Accession NM\_145048) is another VGAM596 host target gene. MGC29898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC29898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MGC29898 BINDING SITE, designated SEQ ID:29679, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25355] Another function of VGAM596 is therefore inhibition of MGC29898 (Accession NM\_145048). Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29898. LOC145955 (Accession XM\_096912) is another VGAM596 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40642, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25356] Another function of VGAM596 is therefore inhibition of LOC145955 (Accession XM\_096912). Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145955. LOC152905 (Accession XM\_017966) is another VGAM596 host target gene. LOC152905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152905 BINDING SITE, designated SEQ ID:30330, to the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, also designated SEQ ID:3307.

[25357] Another function of VGAM596 is therefore inhibition of LOC152905 (Accession XM\_017966). Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152905. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 597 (VGAM597) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25358] VGAM597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM597 was detected is described hereinabove with reference to Figs. 1–8.

[25359] VGAM597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25360] VGAM597 gene encodes a VGAM597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM597 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM597 precursor RNA is designated SEQ ID:583, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:583 is located at position 10633 relative to the genome of Transmissible Gastroenteritis Virus.

[25361] VGAM597 precursor RNA folds onto itself, forming VGAM597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25362] An enzyme complex designated DICER COMPLEX, `dices` the VGAM597 folded precursor RNA into VGAM597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM597 RNA is designated SEQ ID:3308, and is provided hereinbelow with reference to the sequence listing part.

[25363] VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM597 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25364] VGAM597 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM597 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25365] The complementary binding of VGAM597 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM597 host target RNA into VGAM597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25366] It is appreciated that VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM597 host target genes. The mRNA of each one of this plurality of VGAM597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM597 RNA, herein designated VGAM RNA, and which when bound by VGAM597 RNA causes inhibition of translation of respective one or more VGAM597 host target proteins.

[25367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM597 gene, herein designated VGAM GENE, on one or more VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25368] It is yet further appreciated that a function of VGAM597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM597 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM597 correlate with, and may be deduced from, the identity of the host target genes which VGAM597 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25369] Nucleotide sequences of the VGAM597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM597 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM597 are further described hereinbelow with reference to Table 1.

[25370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM597 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM597 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25371] As mentioned hereinabove with reference to Fig. 1, a function of VGAM597 gene, herein designated VGAM is inhibition of expression of VGAM597 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM597 correlate with, and may be deduced from, the identity of the target genes which VGAM597 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25372] CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663) is a VGAM597 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGGBP1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9737, to the nucleotide sequence of VGAM597 RNA, herein designated VGAM RNA, also designated SEQ ID:3308.

[25373] A function of VGAM597 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663). Accordingly, utilities of VGAM597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 598 (VGAM598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25374] VGAM598 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM598 was detected is described hereinabove with reference to Figs. 1–8.

[25375] VGAM598 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25376] VGAM598 gene encodes a VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM598 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM598 precursor RNA is designated SEQ ID:584, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:584 is located at position 7593 relative to the genome of Transmissible Gastroenteritis Virus.

[25377] VGAM598 precursor RNA folds onto itself, forming VGAM598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25378] An enzyme complex designated DICER COMPLEX, `dices` the VGAM598 folded precursor RNA into VGAM598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM598 RNA is designated SEQ ID:3309, and is provided hereinbelow with reference to the sequence listing part.

[25379] VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM598 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25380] VGAM598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM598 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25381] The complementary binding of VGAM598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM598 host tar-

get RNA into VGAM598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25382] It is appreciated that VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM598 host target genes. The mRNA of each one of this plurality of VGAM598 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM598 RNA, herein designated VGAM RNA, and which when bound by VGAM598 RNA causes inhibition of translation of respective one or more VGAM598 host target proteins.

[25383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM598 gene, herein designated VGAM GENE, on one or more VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25384] It is yet further appreciated that a function of VGAM598 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM598 correlate with, and may be deduced from, the identity of the host target genes which VGAM598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25385] Nucleotide sequences of the VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM598 are further

described hereinbelow with reference to Table 1.

[25386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM598 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM598 gene, herein designated VGAM is inhibition of expression of VGAM598 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM598 correlate with, and may be deduced from, the identity of the target genes which VGAM598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25388] BCRP2 (Accession XM\_031102) is a VGAM598 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ

ID:31272, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25389] A function of VGAM598 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053) is another VGAM598 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32996, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25390] Another function of VGAM598 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.FLJ20147 (Accession NM\_017687) is another VGAM598 host target gene. FLJ20147 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:19242, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25391] Another function of VGAM598 is therefore inhibition of FLJ20147 (Accession NM\_017687). Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147. FLJ22060 (Accession NM\_024612) is another VGAM598 host target gene. FLJ22060 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ22060 BINDING SITE, designated SEQ ID:23866, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25392] Another function of VGAM598 is therefore inhibition of FLJ22060 (Accession NM\_024612). Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22060. HIC (Accession XM\_041273) is another VGAM598 host target gene. HIC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC BINDING SITE, designated SEQ ID:33496, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25393] Another function of VGAM598 is therefore inhibition of HIC (Accession XM\_041273). Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession

NM\_003184) is another VGAM598 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:9158, to the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, also designated SEQ ID:3309.

[25394] Another function of VGAM598 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM\_003184). Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 599 (VGAM599) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25395] VGAM599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM599 was detected is described hereinabove with reference to Figs. 1–8.

[25396] VGAM599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25397] VGAM599 gene encodes a VGAM599 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM599 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM599 precursor RNA is designated SEQ ID:585, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:585 is located at position 5831 relative to the genome of Transmissible Gastroenteritis Virus.

[25398] VGAM599 precursor RNA folds onto itself, forming VGAM599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25399] An enzyme complex designated DICER COMPLEX, `dices` the VGAM599 folded precursor RNA into VGAM599 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM599 RNA is designated SEQ ID:3310, and is provided hereinbelow with reference to the sequence listing part.

[25400] VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM599 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25401] VGAM599 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM599 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25402] The complementary binding of VGAM599 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM599 host target RNA into VGAM599 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25403] It is appreciated that VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM599 host target genes. The mRNA of each one of this plurality of VGAM599 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM599 RNA, herein designated VGAM RNA, and which when bound by VGAM599 RNA causes inhibition of translation of respective one or more VGAM599 host target proteins.

[25404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM599 gene, herein designated VGAM GENE, on one or more VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25405] It is yet further appreciated that a function of VGAM599 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM599 correlate with, and may be deduced from, the identity of the host target genes which VGAM599 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25406] Nucleotide sequences of the VGAM599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM599 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM599 are further described hereinbelow with reference to Table 1.

[25407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM599 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25408] As mentioned hereinabove with reference to Fig. 1, a function of VGAM599 gene, herein designated VGAM is inhibition of expression of VGAM599 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM599 correlate with, and may be deduced from, the identity of the target genes which VGAM599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25409] Adducin 3 (gamma) (ADD3, Accession NM\_016824) is a VGAM599 host target gene. ADD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADD3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD3 BINDING SITE, designated SEQ ID:18819, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25410] A function of VGAM599 is therefore inhibition of Adducin 3 (gamma) (ADD3, Accession NM\_016824), a gene which membrane-cytoskeleton-associated protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD3. The function of ADD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM579. Chloride Channel 6 (CLCN6, Accession NM\_021735) is another VGAM599 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:22339, SEQ ID:22344 and SEQ ID:6962 respectively, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25411] Another function of VGAM599 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM\_021735), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 has been established by previous studies. Members of the mammalian CLCN family of voltage-gated chloride channels display differential tissue distribution and perform diverse functions. Nomura et al. (1994) identified a partial human CLCN6 cDNA, which they called KIAA0046. Northern blot analysis revealed that CLCN6 was expressed widely. Using the partial cDNA sequence of Nomura et al. (1994), Brandt and Jentsch (1995) cloned human cerebral cortex cDNAs that covered the entire CLCN6 coding region. The predicted 869-amino acid protein was called CLC6 by them. The amino acid sequence of CLCN6 is 45% identical to that of CLCN7 (OMIM Ref. No. 602727) but only 23 to 29%

identical to the sequences of other known CLCNs. Therefore, Brandt and Jentsch (1995) stated that CLCN6 and CLCN7 together define a new branch of the chloride channel protein family. By Northern blot analysis, Brandt and Jentsch (1995) found that CLCN6 was expressed as an approximately 6-kb mRNA in all tissues examined. Eggermont et al. (1997) identified 4 different CLCN6 cDNAs that represent alternatively spliced transcripts. Nomura et al. (1994) mapped the CLCN6 gene to chromosome 1 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Brandt and Jentsch (1995) refined the localization of the CLCN6 gene to 1p36. They noted that 2 genes encoding kidney-specific chloride channels, CLCNKA (OMIM Ref. No. 602024) and CLCNKB (OMIM Ref. No. 602023), also map to 1p36.

[25412] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25413] REFERENCES 1. Brandt, S.; Jentsch, T. J. : CLC-6 and CLC-7 are two novel broadly expressed members of the CLC chloride channel family. FEBS Lett. 377: 15-20, 1995. ; and

H.; Droogmans, G. : Alternative splicing of CLC-6 (a member of the CLC chloride-channel family) transcripts generates three tr.

[25415] Further studies establishing the function and utilities of CLCN6 are found in John Hopkins OMIM database record ID 602726, and in cited publications numbered 8588-858 and 2255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM\_002358) is another VGAM599 host target gene. MAD2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD2L1 BINDING SITE, designated SEQ ID:8171, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25416] Another function of VGAM599 is therefore inhibition of MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM\_002358), a gene which may monitor the completeness of the spindle-kinetochore attachment. delays

the onset of anaphase when this process is not complete. Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD2L1. The function of MAD2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM176. Origin Recognition Complex, Subunit 4-like (yeast) (ORC4L, Accession XM\_030582) is another VGAM599 host target gene. ORC4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORC4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORC4L BINDING SITE, designated SEQ ID:31091, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25417] Another function of VGAM599 is therefore inhibition of Origin Recognition Complex, Subunit 4-like (yeast) (ORC4L, Accession XM\_030582), a gene which may be required for initiation of DNA replication and has a putative nucleotide triphosphate binding motif. Accordingly, utili-

ties of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC4L. The function of ORC4L has been established by previous studies. In *S. cerevisiae*, sites at which DNA replication initiates are recognized by a 6-subunit origin recognition complex (ORC). The yeast ORC components have been designated ORC1 to 6. By searching an expressed sequence tag database, Quintana et al. (1997) identified mouse and human cDNAs with homology to yeast ORC4. The predicted 436-amino acid human ORC4L protein, which they called HsORC4P, shares 29% sequence identity with yeast ORC4. Antibodies against ORC4L detected a 45-kD doublet on immunoblots of human cell lysates. Immunoprecipitation studies revealed that ORC4L associates with multiple cellular proteins, including ORC2L (OMIM Ref. No. 601182), *in vivo*. By analysis of somatic cell hybrids and by fluorescence *in situ* hybridization, Eki et al. (1998) mapped the ORC4L gene to 2q22-q23.

[25418] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25419] Eki, T.; Dean, F. B.; Kohda, A.; Okumura, K.; Abe, M.; Murakami, Y.; Ishiai, M.; Satomoto, K.; Hurwitz, J.; O'Donnell,

M.; Hanaoka, F. : Assignment1 of the homologue of the yeast origin recognition complex subunit ORC4 (ORC4L) to human chromosome band 2q22–q23 by in situ hybridization and somatic cell hybrid analysis. Cytogenet. Cell Genet. 81: 89–90, 1998. ; and

[25420] Quintana, D. G.; Hou, Z.; Thome, K. C.; Hendricks, M.; Saha, P.; Dutta, A. : Identification of HsORC4, a member of the human origin of replication recognition complex. J. Biol. Chem. 27.

[25421] Further studies establishing the function and utilities of ORC4L are found in John Hopkins OMIM database record ID 603056, and in cited publications numbered 8481 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA Binding Motif Protein 3 (RBM3, Accession XM\_047024) is another VGAM599 host target gene. RBM3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RBM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM3 BINDING SITE, designated SEQ ID:34894, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3310.

[25422] Another function of VGAM599 is therefore inhibition of RNA Binding Motif Protein 3 (RBM3, Accession XM\_047024). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM3. Transforming Growth Factor, Beta Receptor I (activin A receptor type II-like kinase, 53kDa) (TGFB1, Accession NM\_004612) is another VGAM599 host target gene. TGFB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB1 BINDING SITE, designated SEQ ID:10951, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25423] Another function of VGAM599 is therefore inhibition of Transforming Growth Factor, Beta Receptor I (activin A receptor type II-like kinase, 53kDa) (TGFB1, Accession NM\_004612), a gene which forms a complex with TGF beta type II receptor and acts as signal transducer. Accordingly, utilities of VGAM599 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with TGFBR1. The function of TGFBR1 has been established by previous studies. Ebner et al. (1993) cloned a murine serine/threonine kinase receptor that shares a conserved extracellular domain with the type II TGF-beta receptor. Overexpression of this receptor alone did not increase cell surface binding of TGF-beta, but coexpression with the type II TGF-beta receptor caused TGF-beta to bind to this receptor, which had the size of the type I TGF-beta receptor. Overexpression of this newly cloned receptor inhibited binding of TGF-beta to the type II receptor in a dominant-negative fashion. Combinatorial interactions and stoichiometric ratios between the type I and II receptors may therefore determine the extent of TGF-beta binding and the resulting biologic activities. Wang et al. (1994) reported that the type I receptor may be a natural ligand for immunophilin FKBP12 (OMIM Ref. No. 186945). The membrane-bound protein encoded by TGFBR1 binds TGF-beta and forms a heterodimeric complex with the TGF-beta II receptor. Ligand binding by TGF-beta I receptors is dependent on coexpression with type II receptors. Type II receptors alone can bind ligand, but require association with type I receptors for activation

of their kinase (signaling) function. Johnson et al. (1995) used PCR with a hybrid cell DNA panel and FISH to localize the TGFBR1 gene to 9q33–q34. By FISH, Pasche et al. (1998) localized the gene to 9q22. Kuan and Kono (1998) mapped the Tgfr1 gene to mouse chromosome 4. TGFB stimulation leads to phosphorylation and activation of SMAD2 (OMIM Ref. No. 601366) and SMAD3 (OMIM Ref. No. 603109), which form complexes with SMAD4 (OMIM Ref. No. 600993) that accumulate in the nucleus and regulate transcription of target genes. Inman et al. (2002) demonstrated that following TGFB stimulation of epithelial cells, receptors remain active for at least 3 to 4 hours, and continuous receptor activity is required to maintain active SMADs in the nucleus and for TGFB–induced transcription. Continuous nucleocytoplasmic shuttling of the SMADs during active TGFB signaling provides the mechanism whereby the intracellular transducers of the signal continuously monitor receptor activity. These data explain how, at all times, the concentration of active SMADs in the nucleus is directly dictated by the levels of activated receptors in the cytoplasm.

[25424] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [25426] Inman, G. J.; Nicolas, F. J.; Hill, C. S. : Nucleocytoplasmic shuttling of Smads 2, 3, and 4 permits sensing of TGF-beta receptor activity. Molec. Cell 10: 283-294, 2002.
- [25427] Further studies establishing the function and utilities of TGFBR1 are found in John Hopkins OMIM database record ID 190181, and in cited publications numbered 2504-2509, 114 and 10040 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Large Conductance Calcium-activated Channel, Subfamily M, Beta Member 2 (KCNMB2, Accession NM\_005832) is another VGAM599 host target gene. KCNMB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNMB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNMB2 BINDING SITE, designated SEQ ID:12447, to the nucleotide sequence of VGAM599 RNA,

herein designated VGAM RNA, also designated SEQ ID:3310.

[25428] Another function of VGAM599 is therefore inhibition of Potassium Large Conductance Calcium-activated Channel, Subfamily M, Beta Member 2 (KCNMB2, Accession NM\_005832). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB2. KIAA1627 (Accession XM\_087571) is another VGAM599 host target gene. KIAA1627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1627 BINDING SITE, designated SEQ ID:39345, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25429] Another function of VGAM599 is therefore inhibition of KIAA1627 (Accession XM\_087571). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1627. LOC152573 (Accession XM\_087488) is another

VGAM599 host target gene. LOC152573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152573 BINDING SITE, designated SEQ ID:39289, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25430] Another function of VGAM599 is therefore inhibition of LOC152573 (Accession XM\_087488). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152573. LOC202451 (Accession XM\_117401) is another VGAM599 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43440, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25431] Another function of VGAM599 is therefore inhibition of LOC202451 (Accession XM\_117401). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. LOC253039 (Accession XM\_171203) is another VGAM599 host target gene. LOC253039 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253039 BINDING SITE, designated SEQ ID:45994, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25432] Another function of VGAM599 is therefore inhibition of LOC253039 (Accession XM\_171203). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253039. LOC253782 (Accession XM\_171023) is another VGAM599 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45800, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25433] Another function of VGAM599 is therefore inhibition of LOC253782 (Accession XM\_171023). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253782. LOC91801 (Accession NM\_138775) is another VGAM599 host target gene. LOC91801 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91801 BINDING SITE, designated SEQ ID:29010, to the nucleotide sequence of VGAM599 RNA, herein designated VGAM RNA, also designated SEQ ID:3310.

[25434] Another function of VGAM599 is therefore inhibition of LOC91801 (Accession NM\_138775). Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 600 (VGAM600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25435] VGAM600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM600 was detected is described hereinabove with reference to Figs. 1–8.

[25436] VGAM600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25437] VGAM600 gene encodes a VGAM600 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM600 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM600 precursor RNA is designated SEQ ID:586, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:586 is located at position 5005 relative to the genome of Transmissible Gastroenteritis Virus.

[25438] VGAM600 precursor RNA folds onto itself, forming VGAM600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25439] An enzyme complex designated DICER COMPLEX, `dices` the VGAM600 folded precursor RNA into VGAM600 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM600 RNA is designated SEQ ID:3311, and is provided hereinbelow with reference to the sequence listing part.

[25440] VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM600 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25441] VGAM600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM600 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM600 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25442] The complementary binding of VGAM600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM600 host target RNA into VGAM600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25443] It is appreciated that VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM600 host target genes. The mRNA of each one of this plurality of VGAM600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM600 RNA, herein designated VGAM RNA, and which when bound by VGAM600 RNA causes in-

hibition of translation of respective one or more VGAM600 host target proteins.

[25444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM600 gene, herein designated VGAM GENE, on one or more VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25445] It is yet further appreciated that a function of VGAM600 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM600 include diagnosis, prevention and

treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM600 correlate with, and may be deduced from, the identity of the host target genes which VGAM600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25446] Nucleotide sequences of the VGAM600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM600 are further described hereinbelow with reference to Table 1.

[25447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM600 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM600 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25448] As mentioned hereinabove with reference to Fig. 1, a function of VGAM600 gene, herein designated VGAM is inhibition of expression of VGAM600 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM600 correlate with, and may be deduced from, the identity of the target genes which VGAM600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25449] Activation-induced Cytidine Deaminase (AICDA, Accession NM\_020661) is a VGAM600 host target gene. AICDA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AICDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AICDA BINDING SITE, designated SEQ ID:21832, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25450] A function of VGAM600 is therefore inhibition of Activation-induced Cytidine Deaminase (AICDA, Accession NM\_020661), a gene which is a member of the cytidine deaminase family. Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AICDA. The function of AICDA has been established by previous studies. Muramatsu et al. (1999) isolated the gene encoding activation-

induced cytidine deaminase (Aid), a member of the cytidine deaminase family, from a murine B-cell lymphoma line induced by combined stimulation of transforming growth factor-beta (TGFB; 190180), interleukin-4 (IL4; 147780), and CD40 ligand (CD40L; 300386). Muto et al. (2000) isolated the human AID gene, which encodes a 198-amino acid protein containing a conserved cytidine deaminase motif. The human AID protein shares 92% amino acid identity with mouse Aid. RT-PCR analysis of 15 human tissues detected strong expression of AID mRNA in lymph nodes and tonsils. Petersen-Mahrt et al. (2002) hypothesized that the 3 gene diversification processes mediated by AICDA, somatic hypermutation, gene conversion, and class-switch recombination, may be initiated by DNA lesions at dC/dG pairs by AICDA, which has sequence homology to the RNA editing enzyme APOBEC1 (OMIM Ref. No. 600130). Expression of AICDA in E. coli confers a mutator phenotype yielding nucleotide transitions at dC/dG in a context-dependent manner. The mutation triggered by AICDA is enhanced by a deficiency of uracil-DNA glycosylase (UNG; 191525), indicating that AICDA functions by deaminating dC residues in DNA. Petersen-Mahrt et al. (2002) proposed that diversification of

functional Ig genes is triggered by AICDA-mediated deamination of dC residues in the Ig locus with the outcome, i.e., hypermutation phases 1 and 2, gene conversion, or switch recombination, dependent on the way in which the initiating dU/dG lesion is resolved. Muto et al. (2000) mapped the AID gene to 12p13 by FISH. Animal model experiments lend further support to the function of AICDA. Muramatsu et al. (2000) found that in the mouse, Aid deficiency caused a complete defect in class switching and showed a hyper-IgM phenotype with enlarged germinal centers containing strongly activated B cells before or after immunization. Mouse Aid  $-/-$  spleen cells stimulated in vitro with lipopolysaccharide (LPS) and cytokines failed to undergo CSR, although they expressed germline transcripts.

[25451] It is appreciated that the abovementioned animal model for AICDA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[25452] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25453] Muramatsu, M.; Sankaranand, V. S.; Anant, S.; Sugai, M.;

Kinoshita, K.; Davidson, N. O.; Honjo, T. : Specific expression of activation-induced cytidine deaminase (AID), a novel member of the RNA-editing deaminase family in germinal center B cells. J. Biol. Chem. 274: 18470–18476, 1999. ; and

[25454] Muramatsu, M.; Kinoshita, K.; Fagarasan, S.; Yamada, S.; Shinkai, Y.; Honjo, T. : Class switch recombination and hypermutation require activation-induced cytidine deaminase (AID), a pot.

[25455] Further studies establishing the function and utilities of AICDA are found in John Hopkins OMIM database record ID 605257, and in cited publications numbered 4410–4413, 479 and 9131–2317 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor II (thrombin) Receptor (F2R, Accession NM\_001992) is another VGAM600 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:7724, to the nucleotide sequence of VGAM600 RNA,

herein designated VGAM RNA, also designated SEQ ID:3311.

[25456] Another function of VGAM600 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM\_001992), a gene which Thrombin receptor; G protein-coupled receptor involved in platelet activation. Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2R. The function of F2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM\_038377) is another VGAM600 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:32837, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25457] Another function of VGAM600 is therefore inhibition of

Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM\_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_080551) is another VGAM600 host target gene. AP1GBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:27878, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25458] Another function of VGAM600 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_080551). Accordingly, utilities of VGAM600 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. ARSDR1 (Accession NM\_016026) is another VGAM600 host target gene. ARSDR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARSDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARSDR1 BINDING SITE, designated SEQ ID:18109, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25459] Another function of VGAM600 is therefore inhibition of ARSDR1 (Accession NM\_016026). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSDR1. FLJ12688 (Accession XM\_055071) is another VGAM600 host target gene. FLJ12688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12688 BINDING SITE,

designated SEQ ID:36221, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25460] Another function of VGAM600 is therefore inhibition of FLJ12688 (Accession XM\_055071). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12688. FLJ23042 (Accession NM\_025157) is another VGAM600 host target gene. FLJ23042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23042 BINDING SITE, designated SEQ ID:24795, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25461] Another function of VGAM600 is therefore inhibition of FLJ23042 (Accession NM\_025157). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23042. KIAA0391 (Accession NM\_014672) is another VGAM600 host target gene. KIAA0391 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16141, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25462] Another function of VGAM600 is therefore inhibition of KIAA0391 (Accession NM\_014672). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. KIAA1364 (Accession XM\_032997) is another VGAM600 host target gene. KIAA1364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1364 BINDING SITE, designated SEQ ID:31812, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25463] Another function of VGAM600 is therefore inhibition of

KIAA1364 (Accession XM\_032997). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1364. KIAA1586 (Accession XM\_166451) is another VGAM600 host target gene. KIAA1586 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1586 BINDING SITE, designated SEQ ID:44348, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25464] Another function of VGAM600 is therefore inhibition of KIAA1586 (Accession XM\_166451). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1586. MGC13017 (Accession NM\_080656) is another VGAM600 host target gene. MGC13017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC13017 BINDING SITE, designated SEQ ID:27945, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25465] Another function of VGAM600 is therefore inhibition of MGC13017 (Accession NM\_080656). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13017. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792) is another VGAM600 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28057, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25466] Another function of VGAM600 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792). Accordingly, utilities of VGAM600 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PTPNS1. RoXaN (Accession NM\_025013) is another VGAM600 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24601, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25467] Another function of VGAM600 is therefore inhibition of RoXaN (Accession NM\_025013). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. LOC148809 (Accession XM\_086325) is another VGAM600 host target gene. LOC148809 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148809, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148809 BINDING SITE, designated SEQ ID:38593, to the nucleotide se-

quence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25468] Another function of VGAM600 is therefore inhibition of LOC148809 (Accession XM\_086325). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148809. LOC149606 (Accession XM\_086600) is another VGAM600 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38784, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25469] Another function of VGAM600 is therefore inhibition of LOC149606 (Accession XM\_086600). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC153579 (Accession XM\_087714) is another VGAM600 host target gene. LOC153579 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC153579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153579 BINDING SITE, designated SEQ ID:39403, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25470] Another function of VGAM600 is therefore inhibition of LOC153579 (Accession XM\_087714). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153579. LOC200251 (Accession XM\_114173) is another VGAM600 host target gene. LOC200251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200251 BINDING SITE, designated SEQ ID:42755, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25471] Another function of VGAM600 is therefore inhibition of LOC200251 (Accession XM\_114173). Accordingly, utilities

of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200251. LOC202052 (Accession XM\_117355) is another VGAM600 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:43406, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25472] Another function of VGAM600 is therefore inhibition of LOC202052 (Accession XM\_117355). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC90092 (Accession XM\_028862) is another VGAM600 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90092 BINDING SITE, designated SEQ ID:30784, to the nucleotide sequence of VGAM600 RNA, herein designated VGAM RNA, also designated SEQ ID:3311.

[25473] Another function of VGAM600 is therefore inhibition of LOC90092 (Accession XM\_028862). Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90092. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 601 (VGAM601) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25474] VGAM601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM601 was detected is described hereinabove with reference to Figs. 1–8.

[25475] VGAM601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25476] VGAM601 gene encodes a VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM601 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM601 precursor RNA is designated SEQ ID:587, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:587 is located at position 10134 relative to the genome of Transmissible Gastroenteritis Virus.

[25477] VGAM601 precursor RNA folds onto itself, forming VGAM601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM601 folded precursor RNA into VGAM601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM601 RNA is designated SEQ ID:3312, and is provided hereinbelow with reference to the sequence listing part.

[25479] VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM601 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25480] VGAM601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM601 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM601 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25481] The complementary binding of VGAM601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM601 host target RNA into VGAM601 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25482] It is appreciated that VGAM601 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM601 host target genes. The mRNA of each one of this plurality of VGAM601 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM601 RNA, herein designated VGAM RNA, and which when bound by VGAM601 RNA causes inhibition of translation of respective one or more VGAM601 host target proteins.

[25483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM601 gene, herein designated VGAM GENE, on one or more VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[25484] It is yet further appreciated that a function of VGAM601 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM601 correlate with, and may be deduced from, the identity of the host target genes which VGAM601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25485] Nucleotide sequences of the VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM601 are further described hereinbelow with reference to Table 1.

[25486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM601 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM601 gene, herein designated VGAM is inhibition of expression of VGAM601 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM601 correlate with, and may be deduced from, the identity of the target genes which VGAM601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25488] Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004013) is a VGAM601 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10190, SEQ ID:10217 and SEQ ID:10229 respectively, to the nucleotide sequence of VGAM601 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3312.

[25489] A function of VGAM601 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004013), a gene which muscular dystrophy . Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218. Interleukin 18 Receptor Accessory Protein (IL18RAP, Accession NM\_003853) is another VGAM601 host target gene. IL18RAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL18RAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18RAP BINDING SITE, designated SEQ ID:9948, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25490] Another function of VGAM601 is therefore inhibition of Interleukin 18 Receptor Accessory Protein (IL18RAP, Ac-

cession NM\_003853). Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18RAP. Asparaginyl-tRNA Synthetase (NARS, Accession NM\_004539) is another VGAM601 host target gene. NARS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NARS BINDING SITE, designated SEQ ID:10889, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25491] Another function of VGAM601 is therefore inhibition of Asparaginyl-tRNA Synthetase (NARS, Accession NM\_004539), a gene which is ASPARAGINYL-tRNA SYNTHETASE. Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NARS. The function of NARS has been established by previous studies. Using a DNA probe in human-rodent hybrid cells, Shows (1983) found that asparaginyl-tRNA synthetase segregated with peptidase A, a chromosome 18 marker. Cirullo et al. (1983) used the abbreviation-symbol 'asnS.' They isolated hybrids between human peripheral leukocytes and a temperature-sensitive CHO cell line with a thermolabile asparaginyl-tRNA synthetase. Hybrids selected at 39 degrees C required the presence of human chromosome 18. Temperature-resistant hybrid cells contained 2 forms of ASNRS: 1 highly thermal resistant, like the human enzyme, and 1 highly thermolabile, like the CHO mutant enzyme.

[25492] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25493] Cirullo, R. E.; Arredondo-Vega, F. X.; Smith, M.; Wasmuth, J. J. : Isolation and characterization of interspecific heat-

resistant hybrids between a temperature-sensitive Chinese hamster cell asparaginyl-tRNA synthetase mutant and normal human leukocytes: assignment of human asnS gene to chromosome 18. Somat. Cell Genet. 9: 215-233, 1983. ; and

[25494] Shows, T. B. : Personal Communication. Buffalo, N. Y., 1/11/1983.

[25495] Further studies establishing the function and utilities of NARS are found in John Hopkins OMIM database record ID 108410, and in cited publications numbered 1360-1361 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIRAP (Accession NM\_052887) is another VGAM601 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27471, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25496] Another function of VGAM601 is therefore inhibition of TIRAP (Accession NM\_052887), a gene which is a adapter

involved in the TLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189.FLJ23403 (Accession NM\_022068) is another VGAM601 host target gene. FLJ23403 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23403 BINDING SITE, designated SEQ ID:22611, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25497] Another function of VGAM601 is therefore inhibition of FLJ23403 (Accession NM\_022068). Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23403. KIAA1948 (Accession XM\_091984) is another VGAM601 host target gene. KIAA1948 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40074, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25498] Another function of VGAM601 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. LOC142893 (Accession XM\_096354) is another VGAM601 host target gene. LOC142893 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC142893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142893 BINDING SITE, designated SEQ ID:40320, to the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, also designated SEQ ID:3312.

[25499] Another function of VGAM601 is therefore inhibition of

LOC142893 (Accession XM\_096354). Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142893. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 602 (VGAM602) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25500] VGAM602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM602 was detected is described hereinabove with reference to Figs. 1–8.

[25501] VGAM602 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25502] VGAM602 gene encodes a VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM602 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM602 precursor RNA is designated SEQ ID:588, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:588 is located at position 10388 relative to the genome of Transmissible Gastroenteritis Virus.

[25503] VGAM602 precursor RNA folds onto itself, forming VGAM602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25504] An enzyme complex designated DICER COMPLEX, `dices` the VGAM602 folded precursor RNA into VGAM602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide se-

quence of VGAM602 RNA is designated SEQ ID:3313, and is provided hereinbelow with reference to the sequence listing part.

[25505] VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM602 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[25506] VGAM602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM602 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM602 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25507] The complementary binding of VGAM602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM602 host target RNA into VGAM602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25508] It is appreciated that VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM602 host target genes. The mRNA of each one of this plurality of VGAM602 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM602 RNA, herein designated VGAM RNA, and which when bound by VGAM602 RNA causes inhibition of translation of respective one or more VGAM602 host target proteins.

[25509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM602 gene, herein designated VGAM GENE, on one or more VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25510] It is yet further appreciated that a function of VGAM602 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM602 correlate with, and may be deduced from, the identity of the host target genes which VGAM602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25511] Nucleotide sequences of the VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM602 are further described hereinbelow with reference to Table 1.

[25512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM602 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25513] As mentioned hereinabove with reference to Fig. 1, a function of VGAM602 gene, herein designated VGAM is inhibition of expression of VGAM602 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM602 correlate with, and may be deduced from, the identity of the target genes which VGAM602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25514] Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM\_000681) is a VGAM602 host target gene. ADRA2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRA2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2A BINDING SITE, designated SEQ ID:6338, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25515] A function of VGAM602 is therefore inhibition of Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM\_000681), a gene which mediates the effects of epinephrine and norepinephrine. Accordingly, utilities of

VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA2A. The function of ADRA2A has been established by previous studies. Hormones and drugs exert their physiologic and pharmacologic effects by interacting with specific plasma membrane receptors of responsive cells. Adrenergic receptors fall into 2 major classes, alpha and beta, each of which is subdivided into 2 subclasses, termed alpha-1 and alpha-2 and beta-1 and beta-2. The beta-adrenergic receptors, which stimulate, and the alpha-2-adrenergic receptors, which often inhibit adenylate cyclase, are coupled to guanine nucleotide regulatory proteins. Using an alpha-2-adrenergic receptor clone, Yang-Feng et al. (1987) mapped the ADRAR locus to 10q23-q25 by somatic cell hybridization and in situ hybridization. Kobilka et al. (1987) cloned the gene for the human platelet alpha-2-adrenergic receptor using oligonucleotides corresponding to the partial amino acid sequence of the purified receptor. The deduced amino acid sequence is most similar to those of human beta-2- and beta-1-adrenergic receptors. Similarities to the muscarinic cholinergic receptors are also evident. Two related genes were identified by low stringency Southern blot analysis. Hoehe et al. (1988)

identified a DraI RFLP of the ADRAR gene. By study of interspecific backcrosses, Oakey et al. (1991) assigned the Adra2r gene to the distal region of mouse chromosome 19. A substantial percentage of human pregnancies are lost as spontaneous abortions after implantation. This is often caused by an inadequately developed placenta. Proper development of the placental vascular system is essential to nutrient and gas exchange between mother and developing embryo. Philipp et al. (2002) showed that alpha-2-adrenoceptors, which are activated by adrenaline and noradrenaline, are important regulators of placental structure and function. Mice with deletions in the genes Adra2a, Adra2b, and Adra2c died between embryonic days 9.5 and 11.5 from a severe defect in yolk-sac and placenta development. In wildtype placentae, alpha-2-adrenoceptors are abundantly expressed in giant cells, which secrete angiogenic factors to initiate development of the placental vascular labyrinth. In placentae deficient in the 3 adrenoceptors encoded by the 3 genes deleted in these mice, the density of fetal blood vessels in the labyrinth was markedly lower than normal, leading to death of the embryos as a result of reduced oxygen and nutrient supply. Basal phosphorylation of the extracellular

signal-regulated kinases ERK1 (OMIM Ref. No. 601795) and ERK2 (OMIM Ref. No. 176948) was also lower than normal, suggesting that activation of the mitogen-activated protein kinase (MAP kinase) pathway by alpha-2-adrenoceptors is required for placenta and yolk-sac vascular development. Thus, alpha-2-adrenoceptors are essential at the placental interface between mother and embryo to establish the circulatory system of the placenta and thus maintain pregnancy.

[25519] Further studies establishing the function and utilities of ADRA2A are found in John Hopkins OMIM database record

ID 104210, and in cited publications numbered 12104–12113 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BCRP2 (Accession XM\_031102) is another VGAM602 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31271, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25520] Another function of VGAM602 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Dynein, Axonemal, Heavy Polypeptide 9 (DNAH9, Accession NM\_004662) is another VGAM602 host target gene. DNAH9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNAH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DNAH9 BINDING SITE, designated SEQ ID:11032, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25521] Another function of VGAM602 is therefore inhibition of Dynein, Axonemal, Heavy Polypeptide 9 (DNAH9, Accession NM\_004662), a gene which is a microtubule-associated motor protein . Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAH9. The function of DNAH9 has been established by previous studies. Dyneins are microtubule-associated motor protein complexes composed of several heavy, light, and intermediate chains. Two major classes of dyneins, axonemal and cytoplasmic, have been identified. The axonemal dyneins, found in cilia and flagella, are components of the outer and inner dynein arms attached to the peripheral microtubule doublets. See 603297. Vaughan et al. (1996) isolated human partial cDNAs encoding DNAH9 (HL20) and several other dynein heavy chains (DHCs). See DNAH5 (OMIM Ref. No. 603335). Sequence analysis revealed that DNAH9 is an axonemal DHC and is homologous to rat

DLP9. Milisav et al. (1996) identified a human testis cDNA encoding DNAH9, which they called DNEL1. Although the predicted 798-amino acid DNAH9 protein was the size of an intermediate or light dynein chain, it showed extensive homology to the C-terminal region of outer-arm axone-mal dynein beta-heavy chains from sea urchin and other species. The authors suggested that the similarity of DNAH9 to the beta-heavy chains indicates that these genes share a common origin. Northern blot analysis revealed that DNAH9 is expressed as a 3.2-kb mRNA exclusively in testis. Bartoloni et al. (2001) cloned an almost full-length cDNA encoding DNAH9. The deduced 4,486-amino acid protein contains several ATP/GTP-binding sites (P-loops), a microtubule-binding motif, a leucine zipper domain, and several phosphorylation sites. Analysis of 3 overlapping BACs determined that the DNAH9 gene contains 69 exons extending over 373 kb. RT-PCR analysis of nasal epithelium and testis RNA revealed several alternatively spliced transcripts.

[25522] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25523] Milisav, I.; Jones, M. H.; Affara, N. A. : Characterization of

a novel human dynein-related gene that is specifically expressed in testis. *Mammalian Genome* 7: 667-672, 1996.  
; and

[25524] Bartoloni, L.; Blouin, J.-L.; Maiti, A. K.; Sainsbury, A.; Rossier, C.; Gehrig, C.; She, J.-X.; Marron, M. P.; Lander, E. S.; Meeks, M.; Chung, E.; Armengot, M.; Jorissen, M.; Scott, H.

[25525] Further studies establishing the function and utilities of DNAH9 are found in John Hopkins OMIM database record ID 603330, and in cited publications numbered 7495, 7496-749 and 5344 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glycine Receptor, Alpha 3 (GLRA3, Accession XM\_011092) is another VGAM602 host target gene. GLRA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLRA3 BINDING SITE, designated SEQ ID:30168, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25526] Another function of VGAM602 is therefore inhibition of Glycine Receptor, Alpha 3 (GLRA3, Accession XM\_011092), a gene which increases the chloride conductance and thus produces hyperpolarization (inhibition of neuronal firing). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLRA3. The function of GLRA3 has been established by previous studies. The neuronal glycine receptor is a ligand-gated chloride channel composed of ligand-binding alpha and structural beta polypeptides. Kingsmore et al. (1994) mapped the gene encoding the alpha-3 subunit of the glycine receptor to mouse chromosome 8. The human and rat homologs of GLRA3 were cloned by Kuhse et al. (1990). The mouse gene was mapped in relation to Plat (plasminogen activator, tissue type; 173370), which is on human chromosome 8; thus, the human GLRA3 gene may be on human chromosome 8 also. This proved, however, not to be the case; Nikolic et al. (1998) mapped the GLRA3 gene to human 4q33-q34 by fluorescence in situ hybridization. By homology screening of a human fetal brain cDNA library, Nikolic et al. (1998) identified 2 alternative splice variants of the glycine receptor alpha-3 subunit. The amino acid se-

quence predicted for the long alpha-3 variant, designated alpha-3-L, was largely identical to the corresponding rat subunit. In contrast, the novel splice variant, designated alpha-3-K, lacked the coding sequence for 15 amino acids located within the cytoplasmic loop connecting transmembrane spanning region-3 (TM3) and TM4. Using P1 artificial chromosome (PAC) clones, they elucidated the structure of the GLRA3 gene. Two transcripts of 2.4 and 9 kb, corresponding to alpha-3-L and alpha-3-K, respectively, were identified and found to be widely distributed throughout the human central nervous system. Structural analysis of the GLRA3 gene revealed that the alpha-3-K transcript resulted from a complex splice event where excision of the novel exon 8A comprising the alternative sequence of 45 basepairs coincides with the persistence of a large intronic sequence in the 3-prime untranslated region. Functional expression in HEK 293 cells of alpha-3-L and alpha-3-K subunits resulted in the formation of glycine-gated chloride channels that differed significantly in desensitization behavior, thus defining the cytoplasmic loop as an important determinant of the channel inactivation kinetics

[25527] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [25529] Nikolic, Z.; Laube, B.; Weber, R. G.; Lichter, P.; Kioschis, P.; Poustka, A.; Mulhardt, C.; Becker, C.–M. : The human glycine receptor subunit alpha-3: GLRA3 gene structure, chromosomal.
- [25530] Further studies establishing the function and utilities of GLRA3 are found in John Hopkins OMIM database record ID 600421, and in cited publications numbered 10174–10176 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM\_000598) is another VGAM602 host target gene. IGFBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGFBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP3 BINDING SITE, designated SEQ

ID:6196, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25531] Another function of VGAM602 is therefore inhibition of Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM\_000598). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP3. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408) is another VGAM602 host target gene. MGAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8233, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25532] Another function of VGAM602 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession

NM\_002408). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. Thrombomodulin (THBD, Accession NM\_000361) is another VGAM602 host target gene. THBD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THBD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:5917, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25533] Another function of VGAM602 is therefore inhibition of Thrombomodulin (THBD, Accession NM\_000361). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. Zinc Finger Protein 278 (ZNF278, Accession NM\_014323) is another VGAM602 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3, designated SEQ ID:15624, SEQ ID:25773 and SEQ ID:25782 respectively, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25534] Another function of VGAM602 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM\_014323), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414.DKFZp547H025 (Accession NM\_020161) is another VGAM602 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21373, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25535] Another function of VGAM602 is therefore inhibition of DKFZp547H025 (Accession NM\_020161). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. FLJ10044 (Accession NM\_017980) is another VGAM602 host target gene. FLJ10044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10044 BINDING SITE, designated SEQ ID:19710, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25536] Another function of VGAM602 is therefore inhibition of FLJ10044 (Accession NM\_017980). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10044. FLJ11164 (Accession NM\_018346) is another VGAM602

host target gene. FLJ11164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11164 BINDING SITE, designated SEQ ID:20354, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25537] Another function of VGAM602 is therefore inhibition of FLJ11164 (Accession NM\_018346). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11164. Golgi Phosphoprotein 2 (GOLPH2, Accession NM\_016548) is another VGAM602 host target gene. GOLPH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH2 BINDING SITE, designated SEQ ID:18624, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25538] Another function of VGAM602 is therefore inhibition of Golgi Phosphoprotein 2 (GOLPH2, Accession NM\_016548). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH2. KIAA0420 (Accession XM\_032693) is another VGAM602 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31721, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25539] Another function of VGAM602 is therefore inhibition of KIAA0420 (Accession XM\_032693). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA1024 (Accession XM\_044580) is another VGAM602 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1024, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34236, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25540] Another function of VGAM602 is therefore inhibition of KIAA1024 (Accession XM\_044580). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. KIAA1239 (Accession XM\_049078) is another VGAM602 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:35338, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25541] Another function of VGAM602 is therefore inhibition of KIAA1239 (Accession XM\_049078). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1239. MGC4655 (Accession NM\_033309) is another VGAM602 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27143, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25542] Another function of VGAM602 is therefore inhibition of MGC4655 (Accession NM\_033309). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. Polymerase (DNA directed), Epsilon 3 (p17 subunit) (POLE3, Accession NM\_017443) is another VGAM602 host target gene. POLE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLE3 BINDING SITE,

designated SEQ ID:18899, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25543] Another function of VGAM602 is therefore inhibition of Polymerase (DNA directed), Epsilon 3 (p17 subunit) (POLE3, Accession NM\_017443). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLE3. ZID (Accession NM\_006626) is another VGAM602 host target gene. ZID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZID BINDING SITE, designated SEQ ID:13415, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25544] Another function of VGAM602 is therefore inhibition of ZID (Accession NM\_006626). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZID. LOC123283 (Accession XM\_071829) is another VGAM602 host target gene. LOC123283 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC123283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123283 BINDING SITE, designated SEQ ID:37424, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25545] Another function of VGAM602 is therefore inhibition of LOC123283 (Accession XM\_071829). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123283. LOC144266 (Accession XM\_084795) is another VGAM602 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:37708, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25546] Another function of VGAM602 is therefore inhibition of

LOC144266 (Accession XM\_084795). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC253782 (Accession XM\_171023) is another VGAM602 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45795, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25547] Another function of VGAM602 is therefore inhibition of LOC253782 (Accession XM\_171023). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253782. LOC257354 (Accession XM\_170810) is another VGAM602 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45574, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25548] Another function of VGAM602 is therefore inhibition of LOC257354 (Accession XM\_170810). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC51320 (Accession NM\_016626) is another VGAM602 host target gene. LOC51320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51320 BINDING SITE, designated SEQ ID:18740, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25549] Another function of VGAM602 is therefore inhibition of LOC51320 (Accession NM\_016626). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51320. LOC89932 (Accession XM\_027341) is another

VGAM602 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30485, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25550] Another function of VGAM602 is therefore inhibition of LOC89932 (Accession XM\_027341). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. LOC90470 (Accession XM\_031975) is another VGAM602 host target gene. LOC90470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90470 BINDING SITE, designated SEQ ID:31537, to the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, also designated SEQ ID:3313.

[25551] Another function of VGAM602 is therefore inhibition of LOC90470 (Accession XM\_031975). Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90470. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 603 (VGAM603) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25552] VGAM603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM603 was detected is described hereinabove with reference to Figs. 1–8.

[25553] VGAM603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25554] VGAM603 gene encodes a VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM603

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM603 precursor RNA is designated SEQ ID:589, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:589 is located at position 11750 relative to the genome of Transmissible Gastroenteritis Virus.

[25555] VGAM603 precursor RNA folds onto itself, forming VGAM603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25556] An enzyme complex designated DICER COMPLEX, `dices` the VGAM603 folded precursor RNA into VGAM603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM603 RNA is designated SEQ ID:3314, and is provided hereinbelow with reference to the sequence listing part.

[25557] VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM603 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[25558] VGAM603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM603 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM603 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25559] The complementary binding of VGAM603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM603 host target RNA into VGAM603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25560] It is appreciated that VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM603 host target genes. The mRNA of each one of this plurality of VGAM603 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM603 RNA, herein designated VGAM RNA, and which when bound by VGAM603 RNA causes inhibition of translation of respective one or more VGAM603 host target proteins.

[25561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM603 gene, herein designated VGAM GENE, on one or more VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25562] It is yet further appreciated that a function of VGAM603 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM603 correlate with, and may be deduced from, the identity of the host target genes which VGAM603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25563] Nucleotide sequences of the VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM603 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM603 are further described hereinbelow with reference to Table 1.

[25564] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM603 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM603 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[25565] As mentioned hereinabove with reference to Fig. 1, a function of VGAM603 gene, herein designated VGAM is inhibition of expression of VGAM603 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM603 correlate with, and may be deduced from, the identity of the target genes which VGAM603 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25566] Neural Precursor Cell Expressed, Developmentally Down-regulated 4-like (NEDD4L, Accession NM\_015277) is a VGAM603 host target gene. NEDD4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4L BINDING SITE, designated SEQ ID:17606, to the nucleotide sequence of VGAM603 RNA, herein designated VGAM RNA, also designated SEQ ID:3314.

[25567] A function of VGAM603 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4-like (NEDD4L, Accession NM\_015277), a gene

which may play a role in the regulation of epithelial sodium channel function. Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4L. The function of NEDD4L has been established by previous studies. Using cosmids from a human chromosome 18-specific library, Chen et al. (2001) used exon trapping and cDNA cloning to identify a gene homologous to NEDD4. The full-length cDNA sequence of 3,246 bp, obtained by RACE, contains an open reading frame of 2,562 nucleotides. The deduced 854-amino acid polypeptide was predicted to contain 4 WW domains and an HECT ubiquitin-protein ligase domain, highly conserved features in the NEDD4 gene family. The NEDD4L gene has 97% and 62% amino acid sequence identity to mouse Nedd4-2 and human NEDD4 genes, respectively. By expression analysis, a 3.4-kb band was observed in heart and muscle, while a 3.2-kb band and/or an additional 3.6-kb band were seen in other tissues examined. An alternative splicing event involving exon 12 of 60 bp was observed, the shorter allele being predominantly present in brain and lymphocytes, while the longer allele was strongly expressed in kidney and placenta. Since the

NEDD4L gene mapped to the region of 18q21 showing linkage evidence for a susceptibility locus for bipolar affective disorder (OMIM Ref. No. 125480), Chen et al. (2001) screened the NEDD4L gene for mutations in 3 unrelated bipolar I probands and their parents, but no mutations were detected. Due to the potential role of NEDD4L in regulating the epithelial sodium channel (ENaC; OMIM Ref. No. 600228), Chen et al. (2001) proposed it a candidate gene for autosomal dominant orthostatic hypotensive disorder (OMIM Ref. No. 143850), mapped to 18q21. Erdenez and Rothstein (2000) found that the ubiquitination domain of KIAA0439 shares homology with the *S. cerevisiae* Rsp5, a ubiquitin-protein ligase. They analyzed Rsp5 mutant strains and concluded that Rsp5 may be involved in the degradation of the single-stranded DNA-binding protein Rfa1, thereby linking ubiquitin-dependent protein degradation to the replication-recombination machinery.

[25568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25569] Chen, H.; Ross, C. A.; Wang, N.; Huo, Y.; MacKinnon, D. F.; Potash, J. B.; Simpson, S. G.; McMahon, F. J.; DePaulo, J. R.,

Jr.; McInnis, M. G. : NEDD4L on human chromosome 18q21 has multiple forms of transcripts and is a homologue of the mouse Nedd4-2 gene. *Europ. J. Hum. Genet.* 9: 922-930, 2001. ; and

[25570] Erdeniz, N.; Rothstein, R. : Rsp5, a ubiquitin-protein ligase, is involved in degradation of the single-stranded-DNA binding protein Rfa1 in *Saccharomyces cerevisiae*. *Molec. Cell. Bio.*

[25571] Further studies establishing the function and utilities of NEDD4L are found in John Hopkins OMIM database record ID 606384, and in cited publications numbered 6477-647 and 7555 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp566D133 (Accession XM\_050005) is another VGAM603 host target gene. DKFZp566D133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D133 BINDING SITE, designated SEQ ID:35546, to the nucleotide sequence of VGAM603 RNA, herein designated VGAM RNA, also designated SEQ ID:3314.

[25572] Another function of VGAM603 is therefore inhibition of DKFZp566D133 (Accession XM\_050005). Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D133. Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_002758) is another VGAM603 host target gene. MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2, designated SEQ ID:8644 and SEQ ID:25703 respectively, to the nucleotide sequence of VGAM603 RNA, herein designated VGAM RNA, also designated SEQ ID:3314.

[25573] Another function of VGAM603 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_002758). Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K6. LOC253959 (Accession XM\_170749) is another VGAM603

host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45512, to the nucleotide sequence of VGAM603 RNA, herein designated VGAM RNA, also designated SEQ ID:3314.

[25574] Another function of VGAM603 is therefore inhibition of LOC253959 (Accession XM\_170749). Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 604 (VGAM604) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25575] VGAM604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM604 was detected is described

hereinabove with reference to Figs. 1–8.

[25576] VGAM604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25577] VGAM604 gene encodes a VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM604 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM604 precursor RNA is designated SEQ ID:590, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:590 is located at position 9039 relative to the genome of Transmissible Gastroenteritis Virus.

[25578] VGAM604 precursor RNA folds onto itself, forming VGAM604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM604 folded precursor RNA into VGAM604 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM604 RNA is designated SEQ ID:3315, and is provided hereinbelow with reference to the sequence listing part.

[25580] VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM604 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25581] VGAM604 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM604 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25582] The complementary binding of VGAM604 RNA, herein designated VGAM RNA, to host target binding sites on VGAM604 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM604 host target RNA into VGAM604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25583] It is appreciated that VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM604 host target genes. The mRNA of each one of this plurality of VGAM604 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM604 RNA, herein designated VGAM RNA, and which when bound by VGAM604 RNA causes inhibition of translation of respective one or more VGAM604 host target proteins.

[25584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM604 gene, herein designated VGAM GENE, on one or more VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25585] It is yet further appreciated that a function of VGAM604 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM604 correlate with, and may be deduced from, the identity of the host target genes which VGAM604 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25586] Nucleotide sequences of the VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM604 are further described hereinbelow with reference to Table 1.

[25587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM604 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM604 gene, herein designated VGAM is inhibition of expression of VGAM604 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM604 correlate with, and may be deduced from, the identity of the target genes which VGAM604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25589] Aspartoacylase (aminoacylase 2, Canavan disease) (ASPA, Accession NM\_000049) is a VGAM604 host target gene. ASPA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ASPA, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPA BINDING SITE, designated SEQ ID:5489, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25590] A function of VGAM604 is therefore inhibition of Aspartoacylase (aminoacylase 2, Canavan disease) (ASPA, Accession NM\_000049). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPA. Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM\_022051) is another VGAM604 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22588, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25591] Another function of VGAM604 is therefore inhibition of Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm

of arterial smooth muscle cells. Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Early Growth Response 3 (EGR3, Accession XM\_005040) is another VGAM604 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29960, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25592] Another function of VGAM604 is therefore inhibition of Early Growth Response 3 (EGR3, Accession XM\_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM189. Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874) is another VGAM604 host target gene. IFNAR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IFNAR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:6551, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25593] Another function of VGAM604 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2. The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM487. BAI1-associated Protein 1 (BAIAP1, Accession NM\_004742) is another VGAM604 host target gene. BA-

IAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAIAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAIAP1 BINDING SITE, designated SEQ ID:11138, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25594] Another function of VGAM604 is therefore inhibition of BAI1-associated Protein 1 (BAIAP1, Accession NM\_004742). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAIAP1. DKFZp762K2015 (Accession XM\_051791) is another VGAM604 host target gene. DKFZp762K2015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762K2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K2015 BINDING SITE, designated SEQ ID:35885, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM

RNA, also designated SEQ ID:3315.

[25595] Another function of VGAM604 is therefore inhibition of DKFZp762K2015 (Accession XM\_051791). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K2015. FLJ11127 (Accession NM\_019018) is another VGAM604 host target gene. FLJ11127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11127 BINDING SITE, designated SEQ ID:21109, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25596] Another function of VGAM604 is therefore inhibition of FLJ11127 (Accession NM\_019018). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11127. KIAA0391 (Accession NM\_014672) is another VGAM604 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16138, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25597] Another function of VGAM604 is therefore inhibition of KIAA0391 (Accession NM\_014672). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. PAI-RBP1 (Accession NM\_015640) is another VGAM604 host target gene. PAI-RBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAI-RBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAI-RBP1 BINDING SITE, designated SEQ ID:17893, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25598] Another function of VGAM604 is therefore inhibition of PAI-RBP1 (Accession NM\_015640). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PAI-RBP1. SAD1 (Accession XM\_034123) is another VGAM604 host target gene. SAD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAD1 BINDING SITE, designated SEQ ID:32010, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25599] Another function of VGAM604 is therefore inhibition of SAD1 (Accession XM\_034123). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAD1. LOC145868 (Accession XM\_096895) is another VGAM604 host target gene. LOC145868 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145868 BINDING SITE, designated SEQ ID:40620, to the nucleotide se-

quence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25600] Another function of VGAM604 is therefore inhibition of LOC145868 (Accession XM\_096895). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145868. LOC152316 (Accession XM\_098185) is another VGAM604 host target gene. LOC152316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152316 BINDING SITE, designated SEQ ID:41454, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25601] Another function of VGAM604 is therefore inhibition of LOC152316 (Accession XM\_098185). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152316. LOC158230 (Accession XM\_088517) is another VGAM604 host target gene. LOC158230 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC158230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158230 BINDING SITE, designated SEQ ID:39767, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25602] Another function of VGAM604 is therefore inhibition of LOC158230 (Accession XM\_088517). Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158230. LOC91660 (Accession XM\_039902) is another VGAM604 host target gene. LOC91660 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91660 BINDING SITE, designated SEQ ID:33209, to the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, also designated SEQ ID:3315.

[25603] Another function of VGAM604 is therefore inhibition of LOC91660 (Accession XM\_039902). Accordingly, utilities

of VGAM604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91660. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 605 (VGAM605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25604] VGAM605 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM605 was detected is described hereinabove with reference to Figs. 1–8.

[25605] VGAM605 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25606] VGAM605 gene encodes a VGAM605 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM605 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM605 precursor RNA is designated SEQ ID:591, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:591 is located at position 4344 relative to the genome of Transmissible Gastroenteritis Virus.

[25607] VGAM605 precursor RNA folds onto itself, forming VGAM605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25608] An enzyme complex designated DICER COMPLEX, `dices` the VGAM605 folded precursor RNA into VGAM605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM605 RNA is designated SEQ ID:3316, and

is provided hereinbelow with reference to the sequence listing part.

[25609] VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM605 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25610] VGAM605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM605 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25611] The complementary binding of VGAM605 RNA, herein designated VGAM RNA, to host target binding sites on VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM605 host target RNA into VGAM605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25612] It is appreciated that VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM605 host target genes. The mRNA of each one of this plurality of VGAM605 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM605 RNA, herein designated VGAM RNA, and which when bound by VGAM605 RNA causes inhibition of translation of respective one or more VGAM605 host target proteins.

[25613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM605 gene, herein designated VGAM GENE, on one or more VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25614] It is yet further appreciated that a function of VGAM605 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM605 correlate with, and may be deduced from, the identity of the host target genes which VGAM605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25615] Nucleotide sequences of the VGAM605 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM605 are further described hereinbelow with reference to Table 1.

[25616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM605 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25617] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM605 gene, herein designated VGAM is inhibition of expression of VGAM605 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM605 correlate with, and may be deduced from, the identity of the target genes which VGAM605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25618] Enabled Homolog (Drosophila) (ENAH, Accession NM\_018212) is a VGAM605 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20121, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25619] A function of VGAM605 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession NM\_018212). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. ERp44 (Accession XM\_088476) is another VGAM605 host target gene. ERp44 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39724, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25620] Another function of VGAM605 is therefore inhibition of ERp44 (Accession XM\_088476). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. MO25 (Accession NM\_016289) is another VGAM605 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MO25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:18415, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25621] Another function of VGAM605 is therefore inhibition of

MO25 (Accession NM\_016289). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. LOC150372 (Accession XM\_086893) is another VGAM605 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38935, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25622] Another function of VGAM605 is therefore inhibition of LOC150372 (Accession XM\_086893). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC219940 (Accession XM\_167791) is another VGAM605 host target gene. LOC219940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219940 BINDING SITE, designated SEQ ID:44829, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25623] Another function of VGAM605 is therefore inhibition of LOC219940 (Accession XM\_167791). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219940. LOC222166 (Accession XM\_168425) is another VGAM605 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45149, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25624] Another function of VGAM605 is therefore inhibition of LOC222166 (Accession XM\_168425). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC51133 (Accession NM\_016121) is an-

other VGAM605 host target gene. LOC51133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51133 BINDING SITE, designated SEQ ID:18203, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25625] Another function of VGAM605 is therefore inhibition of LOC51133 (Accession NM\_016121). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51133. LOC92181 (Accession XM\_043394) is another VGAM605 host target gene. LOC92181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92181 BINDING SITE, designated SEQ ID:33943, to the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, also designated SEQ ID:3316.

[25626] Another function of VGAM605 is therefore inhibition of LOC92181 (Accession XM\_043394). Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 606 (VGAM606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25627] VGAM606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM606 was detected is described hereinabove with reference to Figs. 1–8.

[25628] VGAM606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible Gastroenteritis Virus. VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25629] VGAM606 gene encodes a VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM606

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM606 precursor RNA is designated SEQ ID:592, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:592 is located at position 6033 relative to the genome of Transmissible Gastroenteritis Virus.

[25630] VGAM606 precursor RNA folds onto itself, forming VGAM606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25631] An enzyme complex designated DICER COMPLEX, `dices` the VGAM606 folded precursor RNA into VGAM606 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM606 RNA is designated SEQ ID:3317, and is provided hereinbelow with reference to the sequence listing part.

[25632] VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM606 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[25633] VGAM606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM606 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25634] The complementary binding of VGAM606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM606 host target RNA into VGAM606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25635] It is appreciated that VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM606 host target genes. The mRNA of each one of this plurality of VGAM606 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM606 RNA, herein designated VGAM RNA, and which when bound by VGAM606 RNA causes inhibition of translation of respective one or more VGAM606 host target proteins.

[25636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM606 gene, herein designated VGAM GENE, on one or more VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25637] It is yet further appreciated that a function of VGAM606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of viral infection by Transmissible Gastroenteritis Virus. Specific functions, and accordingly utilities, of VGAM606 correlate with, and may be deduced from, the identity of the host target genes which VGAM606 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25638] Nucleotide sequences of the VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM606 are further described hereinbelow with reference to Table 1.

[25639] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM606 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM606 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[25640] As mentioned hereinabove with reference to Fig. 1, a function of VGAM606 gene, herein designated VGAM is inhibition of expression of VGAM606 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM606 correlate with, and may be deduced from, the identity of the target genes which VGAM606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25641] Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041) is a VGAM606 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22565, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25642] A function of VGAM606 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM\_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of

VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAN. The function of GAN has been established by previous studies. Giant axonal neuropathy (GAN; 256850), a severe autosomal recessive sensorineural neuropathy affecting both the peripheral nerves and the central nervous system, is characterized by neurofilament accumulation, leading to segmental distention of axons. The neuropathy is part of a generalized disorganization of the cytoskeletal intermediate filaments (IFs), to which neurofilaments belong, as abnormal aggregation of multiple tissue-specific IFs has been reported in this disorder: vimentin (VIM; 193060) in endothelial cells, Schwann cells, and cultured skin fibroblasts, and glial fibrillary acidic protein (GFAP; 137780) in astrocytes (Prineas et al., 1976; Pena, 1982; Bousquet et al., 1996). Keratin intermediate filaments also seem to be altered, as most patients present characteristic curly or kinky hairs (Treiber-Held et al., 1994). Bomont et al. (2000) used a positional cloning approach to isolate a novel, ubiquitously expressed gene that encoded a protein they named gigaxonin and contained mutations associated with giant axonal neuropathy. Gigaxonin contains an N-terminal BTB (broad-complex, tramtrack, and bric-

a-brac) domain followed by 6 kelch repeats, which were predicted to adopt a beta-propeller shape. Distantly related proteins sharing a similar domain organization have various functions associated with the cytoskeleton, predicting that gigaxonin is a novel and distinct cytoskeletal protein that may represent a general pathologic target for other neurodegenerative disorders with alterations in the neurofilament network.

[25643] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25644] Bomont, P.; Cavalier, L.; Blondeau, F.; Ben Hamida, C.; Belal, S.; Tazir, M.; Demir, E.; Topaloglu, H.; Korinthenberg, R.; Tuysuz, B.; Landrieu, P.; Hentati, F.; Koenig, M. : The gene encoding gigaxonin, a new member of the cytoskeletal BTB/kelch repeat family, is mutated in giant axonal neuropathy. *Nature Genet.* 26: 370–374, 2000. ; and

[25645] Bousquet, O.; Basseville, M.; Vila-Porcile, E.; Billette de Villemeur, T.; Hauw, J.-J.; Landrieu, P.; Portier, M.-M. : Aggregation of a subpopulation of vimentin filaments in cultured.

[25646] Further studies establishing the function and utilities of GAN are found in John Hopkins OMIM database record ID

605379, and in cited publications numbered 9215–698 and 9216 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutaminase (GLS, Accession NM\_014905) is another VGAM606 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17113, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25647] Another function of VGAM606 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM\_165873) is another VGAM606 host target gene. HUS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:43791, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25648] Another function of VGAM606 is therefore inhibition of HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM\_165873), a gene which May form DNA damage-responsive protein complex . Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1. The function of HUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228. Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432) is another VGAM606 host target gene. IL20RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL20RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL20RA BINDING SITE, designated SEQ ID:15790, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ

ID:3317.

[25649] Another function of VGAM606 is therefore inhibition of Interleukin 20 Receptor, Alpha (IL20RA, Accession NM\_014432), a gene which is the receptor for interleukin-20. Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL20RA. The function of IL20RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Plastin 1 (I isoform) (PLS1, Accession NM\_002670) is another VGAM606 host target gene. PLS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS1 BINDING SITE, designated SEQ ID:8539, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25650] Another function of VGAM606 is therefore inhibition of Plastin 1 (I isoform) (PLS1, Accession NM\_002670). Accordingly, utilities of VGAM606 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with PLS1. Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965) is another VGAM606 host target gene. C1orf17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf17 BINDING SITE, designated SEQ ID:33851, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25651] Another function of VGAM606 is therefore inhibition of Chromosome 1 Open Reading Frame 17 (C1orf17, Accession XM\_042965). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf17. KIAA0894 (Accession NM\_014896) is another VGAM606 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17061, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25652] Another function of VGAM606 is therefore inhibition of KIAA0894 (Accession NM\_014896). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. KIAA1181 (Accession XM\_043340) is another VGAM606 host target gene. KIAA1181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1181 BINDING SITE, designated SEQ ID:33925, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25653] Another function of VGAM606 is therefore inhibition of KIAA1181 (Accession XM\_043340). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1181. Neural Precursor Cell Expressed, Developmen-

tally Down-regulated 5 (NEDD5, Accession NM\_004404) is another VGAM606 host target gene. NEDD5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEDD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD5 BINDING SITE, designated SEQ ID:10659, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25654] Another function of VGAM606 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 5 (NEDD5, Accession NM\_004404). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD5. LOC154525 (Accession XM\_098554) is another VGAM606 host target gene. LOC154525 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154525 BINDING SITE, designated SEQ ID:41709, to

the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25655] Another function of VGAM606 is therefore inhibition of LOC154525 (Accession XM\_098554). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154525. LOC221271 (Accession XM\_166307) is another VGAM606 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44127, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25656] Another function of VGAM606 is therefore inhibition of LOC221271 (Accession XM\_166307). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. LOC253260 (Accession XM\_171097) is another VGAM606 host target gene. LOC253260 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC253260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253260 BINDING SITE, designated SEQ ID:45910, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25657] Another function of VGAM606 is therefore inhibition of LOC253260 (Accession XM\_171097). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253260. LOC90841 (Accession XM\_034427) is another VGAM606 host target gene. LOC90841 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32115, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25658] Another function of VGAM606 is therefore inhibition of LOC90841 (Accession XM\_034427). Accordingly, utilities

of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. LOC91149 (Accession XM\_036480) is another VGAM606 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32461, to the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, also designated SEQ ID:3317.

[25659] Another function of VGAM606 is therefore inhibition of LOC91149 (Accession XM\_036480). Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 607 (VGAM607) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25660] VGAM607 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM607 was detected is described hereinabove with reference to Figs. 1–8.

[25661] VGAM607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Grassy Stunt Virus. VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25662] VGAM607 gene encodes a VGAM607 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM607 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM607 precursor RNA is designated SEQ ID:593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:593 is located at position 8963 relative to the genome of Rice Grassy Stunt Virus.

[25663] VGAM607 precursor RNA folds onto itself, forming VGAM607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[25664] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM607 folded precursor RNA into VGAM607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM607 RNA is designated SEQ ID:3318, and is provided hereinbelow with reference to the sequence listing part.

[25665] VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM607 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[25666] VGAM607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM607 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25667] The complementary binding of VGAM607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM607 host target RNA into VGAM607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25668] It is appreciated that VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM607 host target genes. The mRNA of each one of this plurality of VGAM607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM607 RNA, herein designated VGAM RNA, and which when bound by VGAM607 RNA causes inhibition of translation of respective one or more VGAM607 host target proteins.

[25669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM607 gene, herein designated VGAM GENE, on one or more VGAM607 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25670] It is yet further appreciated that a function of VGAM607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of viral infection by Rice Grassy Stunt Virus. Specific functions, and accordingly utilities, of VGAM607 correlate with, and may be deduced from, the identity of the host target genes which VGAM607 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25671] Nucleotide sequences of the VGAM607 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM607 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM607 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM607 are further  
described hereinbelow with reference to Table 1.

[25672] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM607 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM607 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[25673] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM607 gene, herein designated VGAM is  
inhibition of expression of VGAM607 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM607 correlate with, and may be deduced  
from, the identity of the target genes which VGAM607  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[25674] Parathyroid Hormone Receptor 2 (PTH2, Accession  
NM\_005048) is a VGAM607 host target gene. PTH2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTHR2 BINDING SITE, designated SEQ ID:11481, to the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, also designated SEQ ID:3318.

[25675] A function of VGAM607 is therefore inhibition of Parathyroid Hormone Receptor 2 (PTHR2, Accession NM\_005048), a gene which is a G protein-coupled receptor selective for parathyroid hormone binding. Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTHR2. The function of PTHR2 has been established by previous studies. Usdin et al. (1995) identified a 7-transmembrane-domain G protein-coupled receptor that selectively recognizes parathyroid hormone (PTH; 168450). The receptor, which they designated PTHR2, is a member of the secretin receptor family of G protein-coupled receptors (see OMIM Ref. No. 182098). There is 30 to 70% amino acid sequence identity between receptors within the secretin receptor family, but these receptors

have essentially no sequence identity with most known G protein-coupled receptors of the rhodopsin family (see OMIM Ref. No. 180380) or with the metabotropic glutamate receptor family (see OMIM Ref. No. 601115). PTHR2 is most similar (51% overall amino acid identity) to the PTH/PTHrP receptor (OMIM Ref. No. 168468). The PTHR2 gene was most abundantly expressed in brain, pancreas, testis, and placenta. Although both PTH and PTH-related peptide (PTHrP; 168470) bind to the PTH/PTHrP receptor and stimulate cAMP accumulation with similar efficacy, only PTH activates PTHR2. To determine the structural basis for this selectivity, Clark et al. (1998) analyzed receptor chimeras in which the amino terminus and third extracellular domains of the 2 receptors were interchanged. Simultaneous interchange of wildtype amino termini and third extracellular loops eliminated agonist activation but not binding for both receptors. These results suggested that the amino terminus and third extracellular loop of the PTH2 and PTH/PTHrP receptors interact similarly with PTH, and that both domains contribute to differential interaction with PTHrP.

[25676] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [25677] Usdin, T. B.; Gruber, C.; Bonner, T. I. : Identification and functional expression of a receptor selectively recognizing parathyroid hormone, the PTH2 receptor. J. Biol. Chem. 270: 15455–15458, 1995. ; and
- [25678] Clark, J. A.; Bonner, T. I.; Kim, A. S.; Usdin, T. B. : Multiple regions of ligand discrimination revealed by analysis of chimeric parathyroid hormone 2 (PTH2) and PTH/PTH-related peptid.
- [25679] Further studies establishing the function and utilities of PTHR2 are found in John Hopkins OMIM database record ID 601469, and in cited publications numbered 6691–6693 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ23017 (Accession NM\_022840) is another VGAM607 host target gene. FLJ23017 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23017 BINDING SITE, designated SEQ ID:23129, to the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, also designated SEQ

ID:3318.

[25680] Another function of VGAM607 is therefore inhibition of FLJ23017 (Accession NM\_022840). Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23017. KIAA1622 (Accession NM\_058237) is another VGAM607 host target gene. KIAA1622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1622 BINDING SITE, designated SEQ ID:27767, to the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, also designated SEQ ID:3318.

[25681] Another function of VGAM607 is therefore inhibition of KIAA1622 (Accession NM\_058237). Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1622. LOC145820 (Accession XM\_085246) is another VGAM607 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37987, to the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, also designated SEQ ID:3318.

[25682] Another function of VGAM607 is therefore inhibition of LOC145820 (Accession XM\_085246). Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC149420 (Accession XM\_086530) is another VGAM607 host target gene. LOC149420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149420 BINDING SITE, designated SEQ ID:38748, to the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, also designated SEQ ID:3318.

[25683] Another function of VGAM607 is therefore inhibition of LOC149420 (Accession XM\_086530). Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC149420. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 608 (VGAM608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25684] VGAM608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM608 was detected is described hereinabove with reference to Figs. 1–8.

[25685] VGAM608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Grass Stunt Virus. VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25686] VGAM608 gene encodes a VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM608 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM608 precursor RNA is designated SEQ

ID:594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:594 is located at position 1950 relative to the genome of Rice Grassy Stunt Virus.

[25687] VGAM608 precursor RNA folds onto itself, forming VGAM608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25688] An enzyme complex designated DICER COMPLEX, `dices` the VGAM608 folded precursor RNA into VGAM608 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM608 RNA is designated SEQ ID:3319, and is provided hereinbelow with reference to the sequence

listing part.

[25689] VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM608 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25690] VGAM608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM608 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM608 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25691] The complementary binding of VGAM608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM608 host target RNA into VGAM608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25692] It is appreciated that VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM608 host target genes. The mRNA of each one of this plurality of VGAM608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM608 RNA, herein designated VGAM

RNA, and which when bound by VGAM608 RNA causes inhibition of translation of respective one or more VGAM608 host target proteins.

[25693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM608 gene, herein designated VGAM GENE, on one or more VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25694] It is yet further appreciated that a function of VGAM608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM608 include diagnosis, prevention and treatment of viral infection by Rice Grassy Stunt Virus. Specific functions, and accordingly utilities, of VGAM608 correlate with, and may be deduced from, the identity of the host target genes which VGAM608 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25695] Nucleotide sequences of the VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM608 are further described hereinbelow with reference to Table 1.

[25696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM608 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25697] As mentioned hereinabove with reference to Fig. 1, a function of VGAM608 gene, herein designated VGAM is

inhibition of expression of VGAM608 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM608 correlate with, and may be deduced from, the identity of the target genes which VGAM608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25698] A Disintegrin and Metalloproteinase Domain 28 (ADAM28, Accession NM\_014265) is a VGAM608 host target gene. ADAM28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM28 BINDING SITE, designated SEQ ID:15541, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25699] A function of VGAM608 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 28 (ADAM28, Accession NM\_014265), a gene which Member of the MDC family of metalloproteinases. Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM28.

The function of ADAM28 has been established by previous studies. ADAM28 belongs to a family of cell surface and secreted glycoproteins that possess both proteolytic and adhesive properties (Bridges et al., 2002). ADAM proteins have been implicated in neurogenesis, fertilization, muscle development, and the release of membrane-anchored proteins. By PCR with degenerate primers on lymph node cDNA, searching sequence databases, and probing a lymph node cDNA library, Roberts et al. (1999) isolated cDNAs encoding 2 splice variants of ADAM28, which they designated MDCL. The deduced 775-amino acid trans-membrane variant, MDCLm, has the typical ADAM domain structure, including signal peptide, propeptide, metallo-protease, disintegrin, cysteine-rich, EGF, and transmembrane domains. The deduced 540-amino acid secreted variant, MDCLs, has signal peptide, propeptide, metallo-protease, and disintegrin domains identical to those of MDCLm; however, its cysteine-rich domain differs in sequence and contains a stop codon midway through. In addition, MDCLm has 6 potential N-linked glycosylation sites, while MDCLs has only 3. Northern blot and RT-PCR analyses revealed expression of a 2.8-kb MDCLm transcript in spleen, lymph node, and, to a lesser extent, in

peripheral blood leukocytes. MDCLs was primarily expressed in spleen as a 2.2-kb transcript. Immunoblot analysis of peripheral blood lymphocytes recognized MDCL proteins of 87 and 67 kD. Immunohistochemical analysis detected expression of MDCL in multiple T- and B-lymphocyte-containing tissues. Jury et al. (1999) cloned ADAM28, which they termed eMDC II, from macaque and human epididymis.

[25700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25701] Bridges, L. C.; Tani, P. H.; Hanson, K. R.; Roberts, C. M.; Judkins, M. B.; Bowditch, R. D. : The lymphocyte metalloprotease MDC-L (ADAM28) is a ligand for the integrin  $\alpha$ -4/ $\beta$ -1. J. Biol. Chem. 277: 3784-3792, 2002. ; and

[25702] Roberts, C. M.; Tani, P. H.; Bridges, L. C.; Laszik, Z.; Bowditch, R. D. : MDC-L, a novel metalloprotease disintegrin cysteine-rich protein family member expressed by human lymphocytes.

[25703] Further studies establishing the function and utilities of ADAM28 are found in John Hopkins OMIM database record ID 606188, and in cited publications numbered

6132–6135 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM\_031363) is another VGAM608 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3, designated SEQ ID:25354, SEQ ID:25360 and SEQ ID:5547 respectively, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25704] Another function of VGAM608 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM\_031363). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386) is another VGAM608 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ ID:7066, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25705] Another function of VGAM608 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.DXS1283E (Accession XM\_047871) is another VGAM608 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35064, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25706] Another function of VGAM608 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423) is another VGAM608 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7131, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25707] Another function of VGAM608 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of

VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Ficolin (collagen/fibrinogen domain containing) 3 (Hakata antigen) (FCN3, Accession NM\_003665) is another VGAM608 host target gene. FCN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FCN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN3 BINDING SITE, designated SEQ ID:9744, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25708] Another function of VGAM608 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing) 3 (Hakata antigen) (FCN3, Accession NM\_003665). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN3. Glutaminase (GLS, Accession NM\_014905) is another VGAM608 host target gene. GLS BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17111, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25709] Another function of VGAM608 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347) is another VGAM608 host target gene. LZTFL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTFL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTFL1 BINDING SITE, designated SEQ ID:21601, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25710] Another function of VGAM608 is therefore inhibition of Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTFL1. Protease, Serine, 16 (thymus) (PRSS16, Accession NM\_005865) is another VGAM608 host target gene. PRSS16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRSS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSS16 BINDING SITE, designated SEQ ID:12482, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25711] Another function of VGAM608 is therefore inhibition of Protease, Serine, 16 (thymus) (PRSS16, Accession NM\_005865). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS16. Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217) is another VGAM608 host target gene. SLC20A1 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by SLC20A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A1 BINDING SITE, designated SEQ ID:29874, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25712] Another function of VGAM608 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217), a gene which could be a sodium-phosphate symporter. Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A1. The function of SLC20A1 has been established by previous studies. By expression in *Xenopus* oocytes and in mammalian cells, Kavanaugh et al. (1994) determined that GLVR1 is a sodium-dependent phosphate symporter. Voltage-clamp analysis indicated net cation influx, suggesting that phosphate is transported with excess sodium ions. Palmer et al. (1999) showed that the GLVR1 gene consists of 11 exons spanning approximately 18 kb of genomic DNA. Exon 1 is noncoding. Using a lu-

ciferase reporter gene assay in transiently transfected chondrocytes and osteoblasts, Palmer et al. (2001) determined that the activity of the promoter of SLC20A1, which they called PIT1, requires a TATA-like sequence and a single SP1 (OMIM Ref. No. 189906) site. They found that this SP1 site could bind SP1 and SP3 (OMIM Ref. No. 601804). Despite the conservation of sequence between the human and mouse promoter, the promoter of mouse Pit1 depends on a combination of several cis-acting elements.

[25713] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25714] Kavanaugh, M. P.; Miller, D. G.; Zhang, W.; Law, W.; Kozak, S. L.; Kabat, D.; Miller, A. D. : Cell-surface receptors for gibbon ape leukemia virus and amphotropic murine retrovirus are inducible sodium-dependent phosphate symporters. Proc. Nat. Acad. Sci. 91: 7071-7075, 1994. ; and

[25715] Palmer, G.; Manen, D.; Bonjour, J.-P.; Caverzasio, J. : Species-specific mechanisms control the activity of the Pit1/PIT1 phosphate transporter gene promoter in mouse and human. Gene 279.

[25716] Further studies establishing the function and utilities of

SLC20A1 are found in John Hopkins OMIM database record ID 137570, and in cited publications numbered 4026–402 and 4007 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM608 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17514, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25717] Another function of VGAM608 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Zinc Finger Protein 215 (ZNF215, Accession NM\_013250) is another VGAM608 host target gene. ZNF215 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF215 BINDING SITE, designated SEQ ID:14912, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25718] Another function of VGAM608 is therefore inhibition of Zinc Finger Protein 215 (ZNF215, Accession NM\_013250). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF215. Apolipoprotein A-V (APOA5, Accession NM\_052968) is another VGAM608 host target gene. APOA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of APOA5 BINDING SITE, designated SEQ ID:27540, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25719] Another function of VGAM608 is therefore inhibition of Apolipoprotein A-V (APOA5, Accession NM\_052968). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOA5. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082) is another VGAM608 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37821, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25720] Another function of VGAM608 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082). Accordingly, utilities of VGAM608 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. Rho Guanine Nucleotide Exchange Factor (GEF) 4 (ARHGEF4, Accession NM\_032995) is another VGAM608 host target gene.

ARHGEF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF4 BINDING SITE, designated SEQ ID:26875, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25721] Another function of VGAM608 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 4 (ARHGEF4, Accession NM\_032995). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF4. ARNTL2 (Accession NM\_020183) is another VGAM608 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21421, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25722] Another function of VGAM608 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. DKFZP727G051 (Accession XM\_045308) is another VGAM608 host target gene. DKFZP727G051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727G051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:34431, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25723] Another function of VGAM608 is therefore inhibition of DKFZP727G051 (Accession XM\_045308). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP727G051. DKFZp761D221 (Accession NM\_032291) is another VGAM608 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D221 BINDING SITE, designated SEQ ID:26058, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25724] Another function of VGAM608 is therefore inhibition of DKFZp761D221 (Accession NM\_032291). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. FLJ10687 (Accession NM\_018178) is another VGAM608 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20012, to the

nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25725] Another function of VGAM608 is therefore inhibition of FLJ10687 (Accession NM\_018178). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ13855 (Accession NM\_023079) is another VGAM608 host target gene. FLJ13855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE, designated SEQ ID:23345, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25726] Another function of VGAM608 is therefore inhibition of FLJ13855 (Accession NM\_023079). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855. FLJ20006 (Accession NM\_017618) is another VGAM608 host target gene. FLJ20006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ20006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20006 BINDING SITE, designated SEQ ID:19119, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25727] Another function of VGAM608 is therefore inhibition of FLJ20006 (Accession NM\_017618). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20006. FLJ20986 (Accession NM\_024524) is another VGAM608 host target gene. FLJ20986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20986 BINDING SITE, designated SEQ ID:23728, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25728] Another function of VGAM608 is therefore inhibition of FLJ20986 (Accession NM\_024524). Accordingly, utilities of

VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20986. KIAA0907 (Accession NM\_014949) is another VGAM608 host target gene. KIAA0907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0907 BINDING SITE, designated SEQ ID:17277, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25729] Another function of VGAM608 is therefore inhibition of KIAA0907 (Accession NM\_014949). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0907. moblak (Accession NM\_130807) is another VGAM608 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING

SITE, designated SEQ ID:28312, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25730] Another function of VGAM608 is therefore inhibition of moblak (Accession NM\_130807). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. PA26 (Accession NM\_014454) is another VGAM608 host target gene. PA26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PA26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PA26 BINDING SITE, designated SEQ ID:15809, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25731] Another function of VGAM608 is therefore inhibition of PA26 (Accession NM\_014454). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PA26. PRO2730 (Accession NM\_025222) is another VGAM608 host target gene. PRO2730 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by PRO2730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2730 BINDING SITE, designated SEQ ID:24900, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25732] Another function of VGAM608 is therefore inhibition of PRO2730 (Accession NM\_025222). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2730. SSH2 (Accession XM\_030846) is another VGAM608 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31187, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25733] Another function of VGAM608 is therefore inhibition of

SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. STAF65(gamma) (Accession NM\_014860) is another VGAM608 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16927, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25734] Another function of VGAM608 is therefore inhibition of STAF65(gamma) (Accession NM\_014860). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). SZF1 (Accession NM\_016089) is another VGAM608 host target gene. SZF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SZF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SZF1 BINDING SITE, designated SEQ ID:18176, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25735] Another function of VGAM608 is therefore inhibition of SZF1 (Accession NM\_016089). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SZF1. LOC134637 (Accession XM\_059727) is another VGAM608 host target gene. LOC134637 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134637 BINDING SITE, designated SEQ ID:37078, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25736] Another function of VGAM608 is therefore inhibition of LOC134637 (Accession XM\_059727). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134637. LOC136345 (Accession XM\_072455) is an-

other VGAM608 host target gene. LOC136345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136345 BINDING SITE, designated SEQ ID:37502, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25737] Another function of VGAM608 is therefore inhibition of LOC136345 (Accession XM\_072455). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136345. LOC147694 (Accession XM\_085843) is another VGAM608 host target gene. LOC147694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147694 BINDING SITE, designated SEQ ID:38373, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25738] Another function of VGAM608 is therefore inhibition of LOC147694 (Accession XM\_085843). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147694. LOC155032 (Accession XM\_098647) is another VGAM608 host target gene. LOC155032 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155032 BINDING SITE, designated SEQ ID:41750, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25739] Another function of VGAM608 is therefore inhibition of LOC155032 (Accession XM\_098647). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155032. LOC158835 (Accession XM\_088683) is another VGAM608 host target gene. LOC158835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158835, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158835 BINDING SITE, designated SEQ ID:39897, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25740] Another function of VGAM608 is therefore inhibition of LOC158835 (Accession XM\_088683). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158835. LOC199991 (Accession XM\_117169) is another VGAM608 host target gene. LOC199991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199991 BINDING SITE, designated SEQ ID:43276, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25741] Another function of VGAM608 is therefore inhibition of LOC199991 (Accession XM\_117169). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199991. LOC255520 (Accession XM\_171073) is another VGAM608 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45880, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25742] Another function of VGAM608 is therefore inhibition of LOC255520 (Accession XM\_171073). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. LOC257358 (Accession XM\_173138) is another VGAM608 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:46391, to the nucleotide sequence of VGAM608 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3319.

[25743] Another function of VGAM608 is therefore inhibition of LOC257358 (Accession XM\_173138). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358. LOC90485 (Accession XM\_032059) is another VGAM608 host target gene. LOC90485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:31556, to the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, also designated SEQ ID:3319.

[25744] Another function of VGAM608 is therefore inhibition of LOC90485 (Accession XM\_032059). Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 609 (VGAM609) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25745] VGAM609 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM609 was detected is described hereinabove with reference to Figs. 1–8.

[25746] VGAM609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Grassy Stunt Virus. VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25747] VGAM609 gene encodes a VGAM609 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM609 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM609 precursor RNA is designated SEQ ID:595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:595 is located at position 8205 relative to the genome of Rice Grassy Stunt Virus.

[25748] VGAM609 precursor RNA folds onto itself, forming

VGAM609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM609 folded precursor RNA into VGAM609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM609 RNA is designated SEQ ID:3320, and is provided hereinbelow with reference to the sequence listing part.

[25750] VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM609 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25751] VGAM609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM609 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25752] The complementary binding of VGAM609 RNA, herein designated VGAM RNA, to host target binding sites on VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM609 host target RNA into VGAM609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25753] It is appreciated that VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM609 host target genes. The mRNA of each one of this plurality of VGAM609 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM609 RNA, herein designated VGAM RNA, and which when bound by VGAM609 RNA causes inhibition of translation of respective one or more VGAM609 host target proteins.

[25754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM609 gene, herein designated VGAM GENE, on one or more VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25755] It is yet further appreciated that a function of VGAM609 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of viral infection by Rice Grass Stunt Virus. Specific functions, and accordingly utilities, of VGAM609 correlate with, and may be deduced from, the identity of the host target genes which VGAM609 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[25756] Nucleotide sequences of the VGAM609 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM609 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM609 are further described hereinbelow with reference to Table 1.

[25757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM609 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM609 gene, herein designated VGAM is inhibition of expression of VGAM609 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM609 correlate with, and may be deduced from, the identity of the target genes which VGAM609 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[25759] Adrenergic, Alpha-2B-, Receptor (ADRA2B, Accession NM\_000682) is a VGAM609 host target gene. ADRA2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRA2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2B BINDING SITE, designated SEQ ID:6340, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25760] A function of VGAM609 is therefore inhibition of Adrenergic, Alpha-2B-, Receptor (ADRA2B, Accession NM\_000682), a gene which mediate the catecholamine-induced inhibition of adenylate cyclase through the action of g proteins. Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA2B. The function of ADRA2B has been established by previous studies. Regan et al. (1988) indicated that in addition to the platelet alpha-2-adrenergic receptor (ADRA2A, encoded by chromosome 10; 104210) and the renal form of receptor

(ADRA2C, encoded by chromosome 4; 104250), a related protein is coded by chromosome 2. Lomasney et al. (1990) also cloned the ADRA2B gene. By hybridization with somatic cell hybrids, they showed that the gene for this receptor is located on chromosome 2. Northern blot analysis of various rat tissues showed expression in liver and kidney. Unique pharmacology and tissue localization suggested that this was a previously unidentified subtype. Alpha-2-adrenergic receptors have a critical role in regulating neurotransmitter release from sympathetic nerves and from adrenergic neurons in the central nervous system. To help elucidate the individual roles of the 3 highly homologous alpha-2-adrenergic receptors (ADRA2A, ADRA2B, and ADRA2C) in this process, Hein et al. (1999) studied neurotransmitter release in mice in which the genes encoding the 3 alpha-2-adrenergic-receptor subtypes were disrupted. By PCR-SSCP analysis, Heinonen et al. (1999) screened the entire coding sequence of the ADRA2B gene in 58 obese, nondiabetic Finns. They identified a polymorphism that led to a deletion of 3 glutamic acids from a glutamic acid repeat element (glu12, amino acids 297 to 309) present in the third intracellular loop of the receptor protein. This repeat element had been shown

to be important for agonist-dependent receptor desensitization.

[25761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25762] Lomasney, J. W.; Lorenz, W.; Allen, L. F.; King, K.; Regan, J. W.; Yang-Feng, T. L.; Caron, M. G.; Lefkowitz, R. J. : Expansion of the alpha-2-adrenergic receptor family: cloning and characterization of a human alpha-2-adrenergic receptor subtype, the gene for which is located on chromosome 2. Proc. Nat. Acad. Sci. 87: 5094-5098, 1990. ; and

[25763] Heinonen, P.; Koulu, M.; Pesonen, U.; Karvonen, M. K.; Rissanen, A.; Laakso, M.; Valve, R.; Uusitupa, M.; Scheinin, M. : Identification of a three-amino acid deletion in the alpha-2B-adr.

[25764] Further studies establishing the function and utilities of ADRA2B are found in John Hopkins OMIM database record ID 104260, and in cited publications numbered 12106-48 and 478 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD8 Antigen, Alpha Polypeptide (p32) (CD8A, Accession NM\_001768) is another VGAM609 host target gene. CD8A

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD8A BINDING SITE, designated SEQ ID:7530, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25765] Another function of VGAM609 is therefore inhibition of CD8 Antigen, Alpha Polypeptide (p32) (CD8A, Accession NM\_001768), a gene which is thought to play a role in the process of t-cell mediated killing. Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD8A. The function of CD8A has been established by previous studies. Comparative structural and functional studies of mouse and human T-cell antigens showed that human cytotoxic-suppressor T cells have a molecule homologous to the mouse Lyt-2,Lyt-3 molecule (Ledbetter et al., 1981). The human homolog of Lyt-2,Lyt-3 is termed LEU2. It is selectively expressed on a subset of T cells and in structure is a multimeric macromolecule composed of individual disulfide-bonded subunits. LEU2, or T8, is ex-

pressed by most T lymphocytes with cytotoxic or suppressor function. The molecule appears to be composed of multimers of a 32-kD and a 45-kD polypeptide in thymocytes and of a 32-kD polypeptide in peripheral blood lymphocytes. LEU2 (like its proposed murine homolog Lyt-2) may play a role in target-cell recognition. Kavathas et al. (1984) isolated genomic and cDNA clones for LEU2. Gibling et al. (1989) showed that through alternative splicing of mRNA, an exon encoding a transmembrane domain of CD8 is deleted. This gives rise to a 30-kD molecule that is secreted and exists as a monomer. The splicing pattern in man differs from that found in the mouse CD8 gene. This mRNA is also alternatively spliced, but an exon encoding a cytoplasmic region is deleted, giving rise to a cell surface molecule that differs in its cytoplasmic tail from the protein encoded by the longer mRNA. Neither protein is secreted. This is an example of the different splicing patterns of 2 homologous mouse and human genes giving rise to different proteins. This represents 1 mechanism of generating diversity during speciation Animal model experiments lend further support to the function of CD8A. Leishman et al. (2001) used tetramer analysis in a mouse model to show that thymus leukemia anti-

gen (TL; 188850), which is expressed abundantly on intestinal epithelial cells, preferentially binds to the homotypic form of CD8A (CD8A–CD8A), in contrast to other major histocompatibility complex molecules that bind to CD8A–CD8B (OMIM Ref. No. 186730). Flow cytometric analysis demonstrated that most intestinal intraepithelial lymphocytes (IELs), but not splenocytes, react specifically to TL tetramers. Leishman et al. (2001) concluded that CD8A–CD8A on IELs acts semiautonomously, rather than as a T-cell receptor coreceptor. They suggested that expression of CD8A–CD8A on IELs could have important regulatory effects that influence homeostasis, activation, and survival of IELs under the high antigen load of the intestine

[25766] It is appreciated that the abovementioned animal model for CD8A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[25767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25768] Kavathas, P.; Sukhatme, V. P.; Herzenberg, L. A.; Parnes, J. R. : Isolation of the gene encoding the human T–

lymphocyte differentiation antigen Leu-2 (T8) by gene transfer and cDNA subtraction. Proc. Nat. Acad. Sci. 81: 7688-7692, 1984. ; and

[25769] Leishman, A. J.; Naidenko, O. V.; Attinger, A.; Koning, F.; Lena, C. J.; Xiong, Y.; Chang, H.-C.; Reinherz, E.; Kronenberg, M.; Cheroutre, H. : T cell responses modulated through interac.

[25770] Further studies establishing the function and utilities of CD8A are found in John Hopkins OMIM database record ID 186910, and in cited publications numbered 6028-6039, 605 and 9776-9778 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ20509 (Accession NM\_017851) is another VGAM609 host target gene. FLJ20509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20509 BINDING SITE, designated SEQ ID:19522, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25771] Another function of VGAM609 is therefore inhibition of

FLJ20509 (Accession NM\_017851). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20509. FLJ21777 (Accession NM\_032209) is another VGAM609 host target gene. FLJ21777 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21777 BINDING SITE, designated SEQ ID:25924, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25772] Another function of VGAM609 is therefore inhibition of FLJ21777 (Accession NM\_032209). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21777. KIAA1586 (Accession XM\_166451) is another VGAM609 host target gene. KIAA1586 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1586 BINDING SITE, designated SEQ ID:44349, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25773] Another function of VGAM609 is therefore inhibition of KIAA1586 (Accession XM\_166451). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1586. KIAA1841 (Accession XM\_087056) is another VGAM609 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:39026, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25774] Another function of VGAM609 is therefore inhibition of KIAA1841 (Accession XM\_087056). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. MGC30052 (Accession NM\_144721) is another

VGAM609 host target gene. MGC30052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC30052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC30052 BINDING SITE, designated SEQ ID:29545, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25775] Another function of VGAM609 is therefore inhibition of MGC30052 (Accession NM\_144721). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC30052. N-myristoyltransferase 1 (NMT1, Accession NM\_021079) is another VGAM609 host target gene. NMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NMT1 BINDING SITE, designated SEQ ID:22049, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25776] Another function of VGAM609 is therefore inhibition of N-myristoyltransferase 1 (NMT1, Accession NM\_021079). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMT1. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM609 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30143, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25777] Another function of VGAM609 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. P5-1 (Accession NM\_006674) is another VGAM609 host target gene. P5-1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:13496, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25778] Another function of VGAM609 is therefore inhibition of P5-1 (Accession NM\_006674). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. Synaptotagmin XIII (SYT13, Accession XM\_167880) is another VGAM609 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44887, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25779] Another function of VGAM609 is therefore inhibition of

Synaptotagmin XIII (SYT13, Accession XM\_167880). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC130813 (Accession XM\_065904) is another VGAM609 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37313, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25780] Another function of VGAM609 is therefore inhibition of LOC130813 (Accession XM\_065904). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC157681 (Accession XM\_088363) is another VGAM609 host target gene. LOC157681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157681 BINDING SITE, designated SEQ ID:39641, to the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, also designated SEQ ID:3320.

[25781] Another function of VGAM609 is therefore inhibition of LOC157681 (Accession XM\_088363). Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157681. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 610 (VGAM610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25782] VGAM610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM610 was detected is described hereinabove with reference to Figs. 1–8.

[25783] VGAM610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Grass Stunt Virus. VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[25784] VGAM610 gene encodes a VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM610 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM610 precursor RNA is designated SEQ ID:596, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:596 is located at position 4515 relative to the genome of Rice Grassy Stunt Virus.

[25785] VGAM610 precursor RNA folds onto itself, forming VGAM610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM610 folded precursor RNA into VGAM610 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM610 RNA is designated SEQ ID:3321, and is provided hereinbelow with reference to the sequence listing part.

[25787] VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM610 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25788] VGAM610 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM610 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25789] The complementary binding of VGAM610 RNA, herein designated VGAM RNA, to host target binding sites on VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM610 host target RNA into VGAM610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25790] It is appreciated that VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM610 host target genes. The mRNA of each one of this plurality of VGAM610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM610 RNA, herein designated VGAM RNA, and which when bound by VGAM610 RNA causes inhibition of translation of respective one or more VGAM610 host target proteins.

[25791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM610 gene, herein designated VGAM GENE, on one or more VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25792] It is yet further appreciated that a function of VGAM610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM610 include diagnosis, prevention and treatment of viral infection by Rice Grass Stunt Virus. Specific functions, and accordingly utilities, of VGAM610 correlate with, and may be deduced from, the identity of the host target genes which VGAM610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25793] Nucleotide sequences of the VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM610 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM610 are further described hereinbelow with reference to Table 1.

[25794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM610 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25795] As mentioned hereinabove with reference to Fig. 1, a function of VGAM610 gene, herein designated VGAM is inhibition of expression of VGAM610 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM610 correlate with, and may be deduced from, the identity of the target genes which VGAM610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25796] Tumor Necrosis Factor Receptor Superfamily, Member 6b, Decoy (TNFRSF6B, Accession NM\_016434) is a VGAM610 host target gene. TNFRSF6B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNFRSF6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF6B BINDING SITE, designated SEQ ID:18557, to the nucleotide sequence of VGAM610 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3321.

[25797] A function of VGAM610 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 6b, Decoy (TNFRSF6B, Accession NM\_016434), a gene which is decoy receptor and protects against apoptosis. Accordingly, utilities of VGAM610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF6B. The function of TNFRSF6B has been established by previous studies. Pitti et al. (1998) identified ESTs that showed homology to the tumor necrosis factor receptor (TNFR) superfamily. Using PCR with primers based on the region of EST consensus, they isolated a cDNA encoding a soluble decoy receptor, termed decoy receptor-3 (DCR3), from a human fetal lung cDNA library. The DCR3 protein contains 300 amino acids and has a molecular mass of 35 kD. By Northern blot analysis, Pitti et al. (1998) detected a 1.2-kb transcript in human fetal lung, brain, and liver, and in adult spleen, colon, and lung. Pitti et al. (1998) demonstrated that DCR3 binds to FASL and inhibits FASL-induced apoptosis. Like osteoprotegerin (OPG; 602643), another TNFR superfamily member, DCR3 lacks an apparent transmembrane sequence, indicating that DCR3 may be a secreted, rather than a membrane-

associated, molecule. The DCR3 protein shares 31% sequence homology with OPG, and all of the cysteines in the 4 cysteine-rich domains of DCR3 and OPG are conserved. Pitti et al. (1998) stated that DCR3 and OPG define a subset of TNFR family members that function as secreted decoys to modulate ligands that induce apoptosis. Bai et al. (2000) independently identified the DCR3 gene, which they called M68. M68 genomic DNA, mRNA, and protein levels were examined in a series of human gastrointestinal tract tumors. Using M68 immunohistochemistry and a scoring system similar to that used for HER-2/neu (ERBB2; 164870), they found that M68 protein was overexpressed in 30 of 68 (44%) human adenocarcinomas of the esophagus, stomach, colon, and rectum. Tumors examined by Northern blot revealed M68 mRNA highly elevated in a similar fraction of primary tumors from the same gastrointestinal tract regions, as well as in 2 colon adenocarcinoma cell lines. They also found M68 protein to be overexpressed in a substantial number of tumors in which gene amplification could not be detected by fluorescence in situ hybridization or quantitative genomic PCR, suggesting that overexpression of M68 may precede amplification in tumors. They found that M68 lies within a

4-gene cluster that includes a novel helicase-like gene related to RAD3/ERCC2 (OMIM Ref. No. 126340), a plasma membrane Ras-related GTPase and a member of the stathmin family (OMIM Ref. No. 151442), amplification or overexpression of which may also contribute to cell growth and tumor progression.

[25798] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25799] Bai, C.; Connolly, B.; Metzker, M. L.; Hilliard, C. A.; Liu, X.; Sandig, V.; Soderman, A.; Galloway, S. M.; Liu, Q.; Austin, C. P.; Caskey, C. T. : Overexpression of M68/DCR3 in human gastrointestinal tract tumors independent of gene amplification and its location in a four-gene cluster. Proc. Nat. Acad. Sci. 97: 1230–1235, 2000. ; and

[25801] Further studies establishing the function and utilities of TNFRSF6B are found in John Hopkins OMIM database record ID 603361, and in cited publications numbered 8657–8658 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 611 (VGAM611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25802] VGAM611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM611 was detected is described hereinabove with reference to Figs. 1–8.

[25803] VGAM611 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25804] VGAM611 gene encodes a VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM611 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM611 precursor RNA is designated SEQ ID:597, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:597 is located at position 62972 relative to the genome of Xestia C-nigrum Granulovirus.

[25805] VGAM611 precursor RNA folds onto itself, forming VGAM611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25806] An enzyme complex designated DICER COMPLEX, `dices` the VGAM611 folded precursor RNA into VGAM611 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM611 RNA is designated SEQ ID:3322, and is provided hereinbelow with reference to the sequence listing part.

[25807] VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM611 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25808] VGAM611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM611 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[25809] The complementary binding of VGAM611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM611 host target RNA into VGAM611 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25810] It is appreciated that VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM611 host target genes. The mRNA of each one of this plurality of VGAM611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM611 RNA, herein designated VGAM RNA, and which when bound by VGAM611 RNA causes in-

hibition of translation of respective one or more VGAM611 host target proteins.

[25811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM611 gene, herein designated VGAM GENE, on one or more VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25812] It is yet further appreciated that a function of VGAM611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM611 include diagnosis, prevention and

treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM611 correlate with, and may be deduced from, the identity of the host target genes which VGAM611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25813] Nucleotide sequences of the VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM611 are further described hereinbelow with reference to Table 1.

[25814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM611 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25815] As mentioned hereinabove with reference to Fig. 1, a function of VGAM611 gene, herein designated VGAM is inhibition of expression of VGAM611 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM611 correlate with, and may be deduced from, the identity of the target genes which VGAM611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25816] Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM\_024758) is a VGAM611 host target gene. AGMAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGMAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:24106, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25817] A function of VGAM611 is therefore inhibition of Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM\_024758). Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGMAT. KIAA0337 (Accession NM\_014786) is another VGAM611 host target gene. KIAA0337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KIAA0337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0337 BINDING SITE, designated SEQ ID:16654, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25818] Another function of VGAM611 is therefore inhibition of KIAA0337 (Accession NM\_014786). Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0337. KIAA0544 (Accession XM\_048119) is another VGAM611 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35110, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25819] Another function of VGAM611 is therefore inhibition of KIAA0544 (Accession XM\_048119). Accordingly, utilities

of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. KIAA0825 (Accession XM\_027906) is another VGAM611 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:30590, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25820] Another function of VGAM611 is therefore inhibition of KIAA0825 (Accession XM\_027906). Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM611 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SDC3 BINDING SITE, designated SEQ ID:16078, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25821] Another function of VGAM611 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. LOC51301 (Accession NM\_016591) is another VGAM611 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18671, to the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, also designated SEQ ID:3322.

[25822] Another function of VGAM611 is therefore inhibition of LOC51301 (Accession NM\_016591). Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 612 (VGAM612) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25823] VGAM612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM612 was detected is described hereinabove with reference to Figs. 1–8.

[25824] VGAM612 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25825] VGAM612 gene encodes a VGAM612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM612 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM612 precursor RNA is designated SEQ ID:598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:598 is located at position 72787 relative to the genome of Xestia

C-nigrum Granulovirus.

[25826] VGAM612 precursor RNA folds onto itself, forming VGAM612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25827] An enzyme complex designated DICER COMPLEX, `dices` the VGAM612 folded precursor RNA into VGAM612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM612 RNA is designated SEQ ID:3323, and is provided hereinbelow with reference to the sequence listing part.

[25828] VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM612 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25829] VGAM612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM612 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25830] The complementary binding of VGAM612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM612 host target RNA into VGAM612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25831] It is appreciated that VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM612 host target genes. The mRNA of each one of this plurality of VGAM612 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM612 RNA, herein designated VGAM RNA, and which when bound by VGAM612 RNA causes inhibition of translation of respective one or more VGAM612 host target proteins.

[25832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM612 gene, herein designated VGAM GENE, on one or more VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25833] It is yet further appreciated that a function of VGAM612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM612 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of

VGAM612 correlate with, and may be deduced from, the identity of the host target genes which VGAM612 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25834] Nucleotide sequences of the VGAM612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM612 are further described hereinbelow with reference to Table 1.

[25835] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM612 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM612 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25836] As mentioned hereinabove with reference to Fig. 1, a function of VGAM612 gene, herein designated VGAM is inhibition of expression of VGAM612 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM612 correlate with, and may be deduced

from, the identity of the target genes which VGAM612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25837] Epithelial V-like Antigen 1 (EVA1, Accession NM\_005797) is a VGAM612 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:12379, to the nucleotide sequence of VGAM612 RNA, herein designated VGAM RNA, also designated SEQ ID:3323.

[25838] A function of VGAM612 is therefore inhibition of Epithelial V-like Antigen 1 (EVA1, Accession NM\_005797). Accordingly, utilities of VGAM612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. DKFZp434E0519 (Accession NM\_032247) is another VGAM612 host target gene. DKFZp434E0519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434E0519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E0519 BINDING SITE, designated SEQ ID:25983, to the nucleotide sequence of VGAM612 RNA, herein designated VGAM RNA, also designated SEQ ID:3323.

[25839] Another function of VGAM612 is therefore inhibition of DKFZp434E0519 (Accession NM\_032247). Accordingly, utilities of VGAM612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E0519. LOC148166 (Accession XM\_086077) is another VGAM612 host target gene. LOC148166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148166 BINDING SITE, designated SEQ ID:38480, to the nucleotide sequence of VGAM612 RNA, herein designated VGAM RNA, also designated SEQ ID:3323.

[25840] Another function of VGAM612 is therefore inhibition of LOC148166 (Accession XM\_086077). Accordingly, utilities of VGAM612 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 613 (VGAM613) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25841] VGAM613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM613 was detected is described hereinabove with reference to Figs. 1–8.

[25842] VGAM613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25843] VGAM613 gene encodes a VGAM613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM613 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM613 precursor RNA is designated SEQ

ID:599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:599 is located at position 74562 relative to the genome of Xestia C-nigrum Granulovirus.

[25844] VGAM613 precursor RNA folds onto itself, forming VGAM613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25845] An enzyme complex designated DICER COMPLEX, `dices` the VGAM613 folded precursor RNA into VGAM613 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM613 RNA is designated SEQ ID:3324, and is provided hereinbelow with reference to the sequence

listing part.

[25846] VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM613 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25847] VGAM613 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM613 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM613 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25848] The complementary binding of VGAM613 RNA, herein designated VGAM RNA, to host target binding sites on VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM613 host target RNA into VGAM613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25849] It is appreciated that VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM613 host target genes. The mRNA of each one of this plurality of VGAM613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM613 RNA, herein designated VGAM

RNA, and which when bound by VGAM613 RNA causes inhibition of translation of respective one or more VGAM613 host target proteins.

[25850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM613 gene, herein designated VGAM GENE, on one or more VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25851] It is yet further appreciated that a function of VGAM613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM613 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM613 correlate with, and may be deduced from, the identity of the host target genes which VGAM613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25852] Nucleotide sequences of the VGAM613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM613 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM613 are further described hereinbelow with reference to Table 1.

[25853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM613 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25854] As mentioned hereinabove with reference to Fig. 1, a function of VGAM613 gene, herein designated VGAM is

inhibition of expression of VGAM613 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM613 correlate with, and may be deduced from, the identity of the target genes which VGAM613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25855] Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM\_024120) is a VGAM613 host target gene. C20orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf7 BINDING SITE, designated SEQ ID:23571, to the nucleotide sequence of VGAM613 RNA, herein designated VGAM RNA, also designated SEQ ID:3324.

[25856] A function of VGAM613 is therefore inhibition of Chromosome 20 Open Reading Frame 7 (C20orf7, Accession NM\_024120). Accordingly, utilities of VGAM613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf7. Eukaryotic Translation Initiation Factor 3, Subunit 1 Alpha, 35kDa (EIF3S1,

Accession XM\_032384) is another VGAM613 host target gene. EIF3S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF3S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF3S1 BINDING SITE, designated SEQ ID:31641, to the nucleotide sequence of VGAM613 RNA, herein designated VGAM RNA, also designated SEQ ID:3324.

[25857] Another function of VGAM613 is therefore inhibition of Eukaryotic Translation Initiation Factor 3, Subunit 1 Alpha, 35kDa (EIF3S1, Accession XM\_032384). Accordingly, utilities of VGAM613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF3S1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 614 (VGAM614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25858] VGAM614 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM614 was detected is described hereinabove with reference to Figs. 1–8.

[25859] VGAM614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C–nigrum Granulovirus. VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25860] VGAM614 gene encodes a VGAM614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM614 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM614 precursor RNA is designated SEQ ID:600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:600 is located at position 74778 relative to the genome of Xestia C–nigrum Granulovirus.

[25861] VGAM614 precursor RNA folds onto itself, forming VGAM614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25862] An enzyme complex designated DICER COMPLEX, `dices` the VGAM614 folded precursor RNA into VGAM614 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM614 RNA is designated SEQ ID:3325, and is provided hereinbelow with reference to the sequence listing part.

[25863] VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM614 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25864] VGAM614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM614 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM614 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25865] The complementary binding of VGAM614 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM614 host target RNA into VGAM614 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25866] It is appreciated that VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM614 host target genes. The mRNA of each one of this plurality of VGAM614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM614 RNA, herein designated VGAM RNA, and which when bound by VGAM614 RNA causes inhibition of translation of respective one or more VGAM614 host target proteins.

[25867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM614 gene, herein designated VGAM GENE, on one or more VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25868] It is yet further appreciated that a function of VGAM614 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM614 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM614 correlate with, and may be deduced from, the identity of the host target genes which VGAM614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25869] Nucleotide sequences of the VGAM614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM614 are further described hereinbelow with reference to Table 1.

[25870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM614 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25871] As mentioned hereinabove with reference to Fig. 1, a function of VGAM614 gene, herein designated VGAM is inhibition of expression of VGAM614 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM614 correlate with, and may be deduced from, the identity of the target genes which VGAM614 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25872] Cytochrome B-245, Beta Polypeptide (chronic granulomatous disease) (CYBB, Accession XM\_084288) is a VGAM614 host target gene. CYBB BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CYBB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYBB BINDING SITE, designated SEQ ID:37536, to the nucleotide sequence of VGAM614 RNA, herein designated VGAM RNA, also designated SEQ ID:3325.

[25873] A function of VGAM614 is therefore inhibition of Cytochrome B-245, Beta Polypeptide (chronic granulomatous disease) (CYBB, Accession XM\_084288). Accordingly, utilities of VGAM614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYBB. HSPC155 (Accession NM\_016406) is another VGAM614 host target gene. HSPC155 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC155 BINDING SITE, designated SEQ ID:18539, to the nucleotide sequence of VGAM614 RNA, herein designated VGAM RNA, also designated SEQ ID:3325.

[25874] Another function of VGAM614 is therefore inhibition of HSPC155 (Accession NM\_016406). Accordingly, utilities of VGAM614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC155. LOC158431 (Accession XM\_098940) is another VGAM614 host target gene. LOC158431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158431 BINDING SITE, designated SEQ ID:41991, to the nucleotide sequence of VGAM614 RNA, herein designated VGAM RNA, also designated SEQ ID:3325.

[25875] Another function of VGAM614 is therefore inhibition of LOC158431 (Accession XM\_098940). Accordingly, utilities of VGAM614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 615 (VGAM615) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[25876] VGAM615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM615 was detected is described hereinabove with reference to Figs. 1–8.

[25877] VGAM615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25878] VGAM615 gene encodes a VGAM615 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM615 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM615 precursor RNA is designated SEQ ID:601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:601 is located at position 128621 relative to the genome of Xestia C-nigrum Granulovirus.

[25879] VGAM615 precursor RNA folds onto itself, forming VGAM615 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[25880] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM615 folded precursor RNA into VGAM615 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 41%) nucleotide se-  
quence of VGAM615 RNA is designated SEQ ID:3326, and  
is provided hereinbelow with reference to the sequence  
listing part.

[25881] VGAM615 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM615 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM615 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25882] VGAM615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM615 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM615 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25883] The complementary binding of VGAM615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM615 host target RNA into VGAM615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25884] It is appreciated that VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM615 host target genes. The mRNA of each one of this plurality of VGAM615 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM615 RNA, herein designated VGAM RNA, and which when bound by VGAM615 RNA causes inhibition of translation of respective one or more VGAM615 host target proteins.

[25885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM615 gene, herein designated VGAM GENE, on one or more VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25886] It is yet further appreciated that a function of VGAM615 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM615 correlate with, and may be deduced from, the identity of the host target genes which VGAM615 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[25887] Nucleotide sequences of the VGAM615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM615 are further described hereinbelow with reference to Table 1.

[25888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM615 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25889] As mentioned hereinabove with reference to Fig. 1, a function of VGAM615 gene, herein designated VGAM is inhibition of expression of VGAM615 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM615 correlate with, and may be deduced from, the identity of the target genes which VGAM615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25890] Axin 1 (AXIN1, Accession XM\_027520) is a VGAM615 host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30514, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25891] A function of VGAM615 is therefore inhibition of Axin 1 (AXIN1, Accession XM\_027520). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883) is another VGAM615 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30965, to the nucleotide sequence of VGAM615 RNA, herein designated

VGAM RNA, also designated SEQ ID:3326.

[25892] Another function of VGAM615 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Formin-like (FMNL, Accession NM\_005892) is another VGAM615 host target gene. FMNL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FMNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMNL BINDING SITE, designated SEQ ID:12512, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25893] Another function of VGAM615 is therefore inhibition of Formin-like (FMNL, Accession NM\_005892), a gene which controls the reorganization of the actin cytoskeleton in association with Rac. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMNL. The function of FMNL has been established by previous studies. By sequencing a recombinant cosmid library, Aronsson et al.

(1998) identified 2 genes, NIK (OMIM Ref. No. 604655) and C17ORF1B. Northern blot analysis revealed that C17ORF1B is expressed as a 1.8-kb transcript in heart, brain, placenta, lung, liver, skeletal muscle, kidney, and pancreas. By directed sequencing of the cosmid library, Aronsson et al. (1998) showed that C17ORF1B contains 11 exons spanning 5.1 kb of genomic DNA. Yayoshi-Yamamoto et al. (2000) isolated cDNAs encoding mouse Frl-alpha and Frl-beta (formin-related gene in leukocytes) that appeared to be homologs of C17ORF1B. Western blot, immunofluorescence, and Northern blot analyses showed that Frl is expressed as a 160-kD cytosolic protein that is highly expressed in spleen, lymph node, and bone marrow cells and that it associates with Rac (see OMIM Ref. No. 602048) and profilin (see OMIM Ref. No. 176610). Yayoshi-Yamamoto et al. (2000) suggested that Frl may play a role in the control of reorganization of the actin cytoskeleton in association with Rac and in the regulation of the signal for cell survival. By FISH and radiation hybrid analysis, Aronsson et al. (1998) mapped the C17ORF1B gene to chromosome 17q21. Using exon-intron maps and mutation screening, Aronsson et al. (1998) found no disease-specific alterations in the C17ORF1B gene in a pedi-

gree with frontotemporal dementia and parkinsonism linked to chromosome 17 (OMIM Ref. No. 600274).

[25894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25895] Aronsson, F. C.; Magnusson, P.; Andersson, B.; Karsten, S. L.; Shibasaki, Y.; Lendon, C. L.; Goate, A. M.; Brookes, A. J. : The NIK protein kinase and C17orf1 genes: chromosomal mapping, gene structures and mutational screening in frontotemporal dementia and parkinsonism linked to chromosome 17. Hum. Genet. 103: 340–345, 1998. ; and

[25896] Yayoshi–Yamamoto, S.; Taniuchi, I.; Watanabe, T. : FRL, a novel formin–related protein, binds to Rac and regulates cell motility and survival of macrophages. Molec. Cell. Biol. 20: 6872.

[25897] Further studies establishing the function and utilities of FMNL are found in John Hopkins OMIM database record ID 604656, and in cited publications numbered 7284–7285 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM\_002028) is another VGAM615 host target gene. FNTB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by FNTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNTB BINDING SITE, designated SEQ ID:7780, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25898] Another function of VGAM615 is therefore inhibition of Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM\_002028), a gene which transfers farnesyl groups to proteins. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNTB. The function of FNTB has been established by previous studies. Andres et al. (1993) localized the gene for the beta subunit of CAAX farnesyltransferase (FNTB) to 14q23–q24 by Southern blot hybridization and PCR analyses of panels of human/Chinese hamster somatic cell hybrid lines and by fluorescence chromosomal in situ hybridization. They found a related farnesyltransferase gene, FNTBL1, on chromosome 9. Long et al. (2002) presented a complete series of structures representing the major steps along the reaction coordinate of the enzyme protein farnesyltransferase. From

these observations, Long et al. (2002) deduced the determinants of substrate specificity and an unusual mechanism in which product release requires binding of substrate, analogous to classically processive enzymes. A structural model for the transition state consistent with previous mechanistic studies was also constructed.

[25899] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25900] Andres, D. A.; Milatovich, A.; Ozcelik, T.; Wenzlau, J. M.; Brown, M. S.; Goldstein, J. L.; Francke, U. : cDNA cloning of the two subunits of human CAAX farnesyltransferase and chromosomal mapping of FNTA and FNTB loci and related sequences. *Genomics* 18: 105–112, 1993. ; and

[25901] Long, S. B.; Casey, P. J.; Beese, L. S. : Reaction path of protein farnesyltransferase at atomic resolution. *Nature* 419: 645–650, 2002.

[25902] Further studies establishing the function and utilities of FNTB are found in John Hopkins OMIM database record ID 134636, and in cited publications numbered 11671–11672 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box D1 (FOXD1, Accession NM\_004472) is

another VGAM615 host target gene. FOXD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD1 BINDING SITE, designated SEQ ID:10778, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25903] Another function of VGAM615 is therefore inhibition of Forkhead Box D1 (FOXD1, Accession NM\_004472), a gene which has regulatory role in embryonic development. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD1. The function of FOXD1 has been established by previous studies. The forkhead genes are transcription factors distinguished by a characteristic 100-amino acid motif that was originally identified in *Drosophila* (see OMIM Ref. No. 164874). Pierrou et al. (1994) identified 7 human genes containing a forkhead domain and designated them forkhead related activators (FREAC) 1 through 7. Northern blot analysis revealed that the FREAC4, or FKHL8, gene is expressed as a 2.1-kb

mRNA exclusively in testis and kidney. These authors determined the DNA binding specificity of FKHL8 through selection of high affinity binding sites from random sequence oligonucleotides. Ernstsson et al. (1996) identified the human forkhead gene FREAC4 (FKHL8) as a nearly full-length cDNA and a 5.2-kb genomic fragment. The intronless gene predicts a protein of 465 amino acids with a hyperacidic N-terminal end, a DNA-binding forkhead domain, and a proline- and alanine-rich C-terminal end. The putative promoter region was active as a reporter fusion in the kidney-derived cell lines 293 and COS-7. Cotransfections with plasmids expressing WT1 (OMIM Ref. No. 607102), WTAR (a mutated form of WT1), p53 (OMIM Ref. No. 191170), and a mutated form of p53 revealed a complex pattern of regulation, suggesting that FREAC4 may be regulated by these gene products. Larsson et al. (1995) mapped the FKHL8 gene to 5q12-q13 by fluorescence in situ hybridization and somatic cell hybrid analysis.

[25904] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[25905] Ernstsson, S.; Pierrou, S.; Hulander, M.; Cederberg, A.; Hellqvist, M.; Carlsson, P.; Enerback, S. : Characterization

of the human forkhead gene FREAC-4. J. Biol. Chem. 271: 21094-21099, 1996. ; and

[25906] Larsson, C.; Hellqvist, M.; Pierrou, S.; White, I.; Enerback, S.; Carlsson, P. : Chromosomal localization of six human forkhead genes, freac-1 (FKHL5), -3 (FKHL7), -4 (FKHL8), -5 (FKHL9.

[25907] Further studies establishing the function and utilities of FOXD1 are found in John Hopkins OMIM database record ID 601091, and in cited publications numbered 9461-9460 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250) is another VGAM615 host target gene. KCNN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNN4 BINDING SITE, designated SEQ ID:8035, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25908] Another function of VGAM615 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250), a gene which forms a voltage-independent potassium channel that is activated by intracellular calcium. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN4. The function of KCNN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Lymphocyte Antigen 6 Complex, Locus E (LY6E, Accession NM\_002346) is another VGAM615 host target gene. LY6E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY6E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY6E BINDING SITE, designated SEQ ID:8146, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25909] Another function of VGAM615 is therefore inhibition of Lymphocyte Antigen 6 Complex, Locus E (LY6E, Accession

NM\_002346). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY6E. MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359) is another VGAM615 host target gene. MADH4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:11831, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25910] Another function of VGAM615 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM\_005359), a gene which common mediator of signal transduction by  $\text{tgf-}\beta$  (transforming growth factor) superfamily;  $\text{smad4}$  is the common  $\text{smad}$  (co- $\text{smad}$ ). promotes binding of the  $\text{smad2/smاد4/fast-1}$  complex to dna and provides an activation function required for  $\text{smad1}$  or  $\text{smad2}$  to stimulate transcription. may act as a tumor suppressor. Accord-

ingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH4. The function of MADH4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to

VGAM217. Microtubule-associated Protein Tau (MAPT, Accession NM\_016834) is another VGAM615 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:18828, SEQ ID:12540, SEQ ID:18834 and SEQ ID:18840 respectively, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25911] Another function of VGAM615 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM\_016834), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly,

utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPT. The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. MLL Septin-like Fusion (MSF, Accession XM\_113892) is another VGAM615 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42523, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25912] Another function of VGAM615 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM\_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM514. Neuroglobin (NGB, Accession NM\_021257) is another VGAM615 host target gene. NGB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGB BINDING SITE, designated SEQ ID:22233, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25913] Another function of VGAM615 is therefore inhibition of Neuroglobin (NGB, Accession NM\_021257), a gene which has function in oxygen transport and storage in humans. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGB. The function of NGB has been established by previous studies. By EST database searching for globin-like sequences, Burmester et al. (2000) identified cDNAs encoding human and mouse neuroglobin, symbolized NGB. Sequence analysis predicted that the 151-amino acid mouse and human proteins share 94% identity with each other but less than 25% identity with other vertebrate globins. RNA dot blot analysis revealed

predominant expression in the brain, with strongest signals observed in the frontal lobe, the subthalamic nucleus, and the thalamus. In situ hybridization analysis demonstrated expression in mouse brain neuronal cells. RT-PCR detected only trace amounts of Ngb in other mouse tissues. Biochemical purification and size-exclusion chromatographic analysis showed that Ngb is a 16-kD monomer, found in low concentrations in mouse brain, that reversibly binds oxygen with an affinity nearly as high as that of MB but higher than that of HB. Genomic sequence analysis of a PAC clone determined that the NGB gene has a 4 exon/3 intron structure, distinct from that of other globin genes, and a promoter region that contains several putative SP1 (OMIM Ref. No. 189906)-binding sites. Five-prime RACE identified at least 3 transcription starting points but no TATA box, suggesting a house-keeping promoter. In an accompanying editorial, Moens and Dewilde (2000) noted that regions of the brain with lower expression of NGB (e.g., hippocampus) have lower resistance to ischemia and are frequently affected by neurofibrillary tangles in Alzheimer disease.

[25914] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [25915] Burmester, T.; Weich, B.; Reinhardt, S.; Hankeln, T. : A vertebrate globin expressed in the brain. *Nature* 407: 520–523, 2000. ; and
- [25916] Moens, L.; Dewilde, S. : Globins in the brain. *Nature* 407: 461–462, 2000.
- [25917] Further studies establishing the function and utilities of NGB are found in John Hopkins OMIM database record ID 605304, and in cited publications numbered 7476–7477 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuropeptide Y Receptor Y2 (NPY2R, Accession NM\_000910) is another VGAM615 host target gene. NPY2R BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPY2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPY2R BINDING SITE, designated SEQ ID:6609, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.
- [25918] Another function of VGAM615 is therefore inhibition of Neuropeptide Y Receptor Y2 (NPY2R, Accession

NM\_000910), a gene which stimulates intracellular calcium flux and may modulate psychomotor activity, food intake, endocrine secretion and vasoconstriction. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPY2R. The function of NPY2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309. Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM\_013385) is another VGAM615 host target gene. PSCD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD4 BINDING SITE, designated SEQ ID:15037, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25919] Another function of VGAM615 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM\_013385), a gene which promotes

guanine–nucleotide exchange on arf1 and arf5. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD4. The function of PSCD4 has been established by previous studies. ADP–ribosylation factors, or ARFS (see OMIM Ref. No. ARF1; 103180), are small GTP–binding proteins within the Ras superfamily that regulate vesicle trafficking in eukaryotic cells. ARF1 recruits coat proteins (e.g., COPA; 601924) to membranes on the cytoplasmic face of the Golgi apparatus. The PSCD proteins (e.g., PSCD1; 182115), a family of proteins containing a C–terminal pleckstrin homology (PH) domain and a central 200–amino acid region similar to a domain within the yeast Sec7 protein, which is required for vesicular traffic of polypeptides through the Golgi, function as guanine–nucleotide exchange factors (GEFs) for ARFs. Klarlund et al. (1997) identified a cDNA encoding mouse Grp1 (general receptor for phosphoinositides–1) by screening mouse adipocyte and brain cDNA expression libraries with phosphoinositide probes. By searching an EST database for sequences similar to mouse brain Grp1, followed by PCR and screening of a human blood cDNA library, Venkateswarlu et al. (1998) obtained a cDNA encoding

PSCD3, which they called GRP1. Sequence analysis showed that the predicted 399–amino acid PSCD3 protein contains a 39–amino acid coiled–coil domain, a 172–amino acid Sec7 domain, and a 118–amino acid PH domain. PSCD3 shares 82.7% and 79.5% amino acid identity with PSCD1 and PSCD2 (OMIM Ref. No. 602488), respectively, as well as 98.8% identity with mouse Grp1. By Scatchard and mutational analyses, Venkateswarlu et al. (1998) determined that PSCD3 binds via its PH domain to the inositol head group of phosphatidylinositol 3,4,5–triphosphate with high affinity. Confocal laser microscopy demonstrated that stimulation of cells with either epidermal growth factor (EGF; 131530) or nerve growth factor (NGF; 162030) results in PH domain–dependent translocation of PSCD3 from the cytosol to the plasma membrane. The translocation was rapid and transient with EGF, whereas NGF mediated a relatively longer translocation. By searching an EST database for Sec7 domain–related sequences and by screening a placenta cDNA library, Franco et al. (1998) isolated a cDNA encoding PSCD3, which they called ARNO3. Northern blot analysis revealed that PSCD3, in contrast to the ubiquitously expressed PSCD1 and PSCD2, is expressed as a 4.5–kb transcript that is almost absent

from liver, thymus, and peripheral blood lymphocytes. Franco et al. (1998) found that PSCD3, like PSCD1 and PSCD2, shows GEF activity, mediated by the Sec7 domain, towards ARF1 but not ARF6 (OMIM Ref. No. 600464). Immunofluorescence microscopy indicated that overexpression of PSCD3 induces major morphologic alterations of the Golgi apparatus, including redistribution of Golgi resident proteins and the coat protein COPB (OMIM Ref. No. 600959). Lietzke et al. (2000) and Ferguson et al. (2000) determined the structure of the GRP1 PH domain in the unliganded form and bound to inositol 1,3,4,5-tetraphosphate. Lietzke et al. (2000) found that a novel mode of phosphoinositide recognition involving a 20-residue insertion within the beta-6/beta-7 loop explains the unusually high specificity of the GRP1 PH domain and the promiscuous 3-phosphoinositide binding typical of several other PH domains, including that of protein kinase B (AKT1; 164730). By comparing the GRP1 PH domain to other PH domains, general determinants of 3-phosphoinositide recognition and specificity could be deduced.

[25920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [25921] Ferguson, K. M.; Kavran, J. M.; Sankaran, V. G.; Fournier, E.; Isakoff, S. J.; Skolnik, E. Y.; Lemmon, M. A. : Structural basis for discrimination of 3-phosphoinositides by pleckstrin homology domains. *Molec. Cell* 6: 373–384, 2000. ; and
- [25922] Franco, M.; Boretto, J.; Robineau, S.; Monier, S.; Goud, B.; Chardin, P.; Chavrier, P. : ARNO3, a Sec7-domain guanine nucleotide exchange factor for ADP ribosylation factor 1, is invol.
- [25923] Further studies establishing the function and utilities of PSCD4 are found in John Hopkins OMIM database record ID 606514, and in cited publications numbered 10705 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAN Binding Protein 3 (RANBP3, Accession NM\_003624) is another VGAM615 host target gene. RANBP3 BINDING SITE1 and RANBP3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RANBP3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP3 BINDING SITE1 and RANBP3 BINDING SITE2, des-

ignated SEQ ID:9688 and SEQ ID:14240 respectively, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25924] Another function of VGAM615 is therefore inhibition of RAN Binding Protein 3 (RANBP3, Accession NM\_003624). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP3. Chromosome 1 Open Reading Frame 2 (C1orf2, Accession NM\_006589) is another VGAM615 host target gene. C1orf2 BINDING SITE1 and C1orf2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C1orf2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf2 BINDING SITE1 and C1orf2 BINDING SITE2, designated SEQ ID:13356 and SEQ ID:45396 respectively, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25925] Another function of VGAM615 is therefore inhibition of Chromosome 1 Open Reading Frame 2 (C1orf2, Accession NM\_006589). Accordingly, utilities of VGAM615 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf2. DKFZP434J193 (Accession XM\_048452) is another VGAM615 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35164, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25926] Another function of VGAM615 is therefore inhibition of DKFZP434J193 (Accession XM\_048452). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. DKFZp586I021 (Accession NM\_032271) is another VGAM615 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZp586I021 BINDING SITE, designated SEQ ID:26021, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25927] Another function of VGAM615 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. FLJ22215 (Accession NM\_022834) is another VGAM615 host target gene. FLJ22215 BINDING SITE1 and FLJ22215 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ22215, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE1 and FLJ22215 BINDING SITE2, designated SEQ ID:23118 and SEQ ID:46280 respectively, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25928] Another function of VGAM615 is therefore inhibition of FLJ22215 (Accession NM\_022834). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ22215. KIAA0455 (Accession XM\_051785) is another VGAM615 host target gene. KIAA0455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:35881, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25929] Another function of VGAM615 is therefore inhibition of KIAA0455 (Accession XM\_051785). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455. MCFP (Accession NM\_018843) is another VGAM615 host target gene. MCFP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MCFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCFP BINDING SITE, designated SEQ ID:20828, to the nucleotide sequence of

VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25930] Another function of VGAM615 is therefore inhibition of MCFP (Accession NM\_018843). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCFP. MGC15730 (Accession NM\_032880) is another VGAM615 host target gene. MGC15730 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15730 BINDING SITE, designated SEQ ID:26701, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25931] Another function of VGAM615 is therefore inhibition of MGC15730 (Accession NM\_032880). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15730. Neural Precursor Cell Expressed, Developmentally Down-regulated 5 (NEDD5, Accession NM\_004404) is another VGAM615 host target gene.

NEDD5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEDD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD5 BINDING SITE, designated SEQ ID:10657, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25932] Another function of VGAM615 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 5 (NEDD5, Accession NM\_004404). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD5. LOC128710 (Accession XM\_059267) is another VGAM615 host target gene. LOC128710 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128710 BINDING SITE, designated SEQ ID:36934, to the nucleotide sequence of VGAM615 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3326.

[25933] Another function of VGAM615 is therefore inhibition of LOC128710 (Accession XM\_059267). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128710. LOC146381 (Accession XM\_085439) is another VGAM615 host target gene. LOC146381 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146381 BINDING SITE, designated SEQ ID:38145, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25934] Another function of VGAM615 is therefore inhibition of LOC146381 (Accession XM\_085439). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146381. LOC197439 (Accession XM\_113889) is another VGAM615 host target gene. LOC197439 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197439, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197439 BINDING SITE, designated SEQ ID:42517, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25935] Another function of VGAM615 is therefore inhibition of LOC197439 (Accession XM\_113889). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197439. LOC245811 (Accession XM\_168197) is another VGAM615 host target gene. LOC245811 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245811 BINDING SITE, designated SEQ ID:45070, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25936] Another function of VGAM615 is therefore inhibition of LOC245811 (Accession XM\_168197). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC245811. LOC92573 (Accession XM\_045884) is another VGAM615 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34595, to the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, also designated SEQ ID:3326.

[25937] Another function of VGAM615 is therefore inhibition of LOC92573 (Accession XM\_045884). Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 616 (VGAM616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25938] VGAM616 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM616 was detected is described hereinabove with reference to Figs. 1–8.

[25939] VGAM616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25940] VGAM616 gene encodes a VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM616 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM616 precursor RNA is designated SEQ ID:602, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:602 is located at position 128882 relative to the genome of Xestia C-nigrum Granulovirus.

[25941] VGAM616 precursor RNA folds onto itself, forming VGAM616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25942] An enzyme complex designated DICER COMPLEX, `dices` the VGAM616 folded precursor RNA into VGAM616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM616 RNA is designated SEQ ID:3327, and is provided hereinbelow with reference to the sequence listing part.

[25943] VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM616 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25944] VGAM616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM616 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25945] The complementary binding of VGAM616 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM616 host target RNA into VGAM616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25946] It is appreciated that VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM616 host target genes. The mRNA of each one of this plurality of VGAM616 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM616 RNA, herein designated VGAM RNA, and which when bound by VGAM616 RNA causes inhibition of translation of respective one or more VGAM616 host target proteins.

[25947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM616 gene, herein designated VGAM GENE, on one or more VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25948] It is yet further appreciated that a function of VGAM616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM616 correlate with, and may be deduced from, the identity of the host target genes which VGAM616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25949] Nucleotide sequences of the VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM616 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM616 are further described hereinbelow with reference to Table 1.

[25950] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM616 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM616 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25951] As mentioned hereinabove with reference to Fig. 1, a function of VGAM616 gene, herein designated VGAM is inhibition of expression of VGAM616 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM616 correlate with, and may be deduced from, the identity of the target genes which VGAM616 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25952] Copine III (CPNE3, Accession NM\_003909) is a VGAM616 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9998, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25953] A function of VGAM616 is therefore inhibition of Copine III (CPNE3, Accession NM\_003909), a gene which may function in membrane trafficking. Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005) is another VGAM616 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ

ID:15216, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25954] Another function of VGAM616 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Src-like-adaptor (SLA, Accession NM\_006748) is another VGAM616 host target gene. SLA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLA BINDING SITE, designated SEQ ID:13595, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25955] Another function of VGAM616 is therefore inhibition of

Src-like-adaptor (SLA, Accession NM\_006748), a gene which is a negative regulator of T-cell receptor signaling. Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA. The function of SLA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM383. ARHGAP10 (Accession NM\_020824) is another VGAM616 host target gene. ARHGAP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP10 BINDING SITE, designated SEQ ID:21889, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25956] Another function of VGAM616 is therefore inhibition of ARHGAP10 (Accession NM\_020824). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP10. BCL2-associated Athanogene 5 (BAG5, Acces-

sion NM\_004873) is another VGAM616 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11308, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25957] Another function of VGAM616 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM\_004873). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045) is another VGAM616 host target gene. C20orf45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf45 BINDING SITE, designated SEQ ID:18123, to the nucleotide sequence of VGAM616 RNA,

herein designated VGAM RNA, also designated SEQ ID:3327.

[25958] Another function of VGAM616 is therefore inhibition of Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf45.

FLJ14437 (Accession NM\_032578) is another VGAM616 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26311, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25959] Another function of VGAM616 is therefore inhibition of FLJ14437 (Accession NM\_032578). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. FLJ20725 (Accession NM\_017943) is another VGAM616 host target gene. FLJ20725 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ20725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20725 BINDING SITE, designated SEQ ID:19637, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25960] Another function of VGAM616 is therefore inhibition of FLJ20725 (Accession NM\_017943). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20725. KIAA0350 (Accession XM\_028332) is another VGAM616 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30667, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25961] Another function of VGAM616 is therefore inhibition of

KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0947 (Accession XM\_029101) is another VGAM616 host target gene. KIAA0947 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0947, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0947 BINDING SITE, designated SEQ ID:30849, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25962] Another function of VGAM616 is therefore inhibition of KIAA0947 (Accession XM\_029101). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0947. KIAA1322 (Accession XM\_052626) is another VGAM616 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36026, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25963] Another function of VGAM616 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1376 (Accession XM\_033042) is another VGAM616 host target gene. KIAA1376 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1376 BINDING SITE, designated SEQ ID:31824, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25964] Another function of VGAM616 is therefore inhibition of KIAA1376 (Accession XM\_033042). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1376. KIAA1870 (Accession NM\_032161) is another

VGAM616 host target gene. KIAA1870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1870 BINDING SITE, designated SEQ ID:25862, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25965] Another function of VGAM616 is therefore inhibition of KIAA1870 (Accession NM\_032161). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1870. MBLL39 (Accession NM\_144778) is another VGAM616 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBLL39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:29569, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25966] Another function of VGAM616 is therefore inhibition of MBLL39 (Accession NM\_144778). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. SCYB10 (Accession NM\_001565) is another VGAM616 host target gene. SCYB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB10 BINDING SITE, designated SEQ ID:7294, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25967] Another function of VGAM616 is therefore inhibition of SCYB10 (Accession NM\_001565). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB10. LOC151877 (Accession XM\_098132) is another VGAM616 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41396, to the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, also designated SEQ ID:3327.

[25968] Another function of VGAM616 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 617 (VGAM617) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25969] VGAM617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM617 was detected is described hereinabove with reference to Figs. 1–8.

[25970] VGAM617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia C-nigrum Granulovirus. VGAM617 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25971] VGAM617 gene encodes a VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM617 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM617 precursor RNA is designated SEQ ID:603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:603 is located at position 140057 relative to the genome of Xes-tia C-nigrum Granulovirus.

[25972] VGAM617 precursor RNA folds onto itself, forming VGAM617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25973] An enzyme complex designated DICER COMPLEX, `dices` the VGAM617 folded precursor RNA into VGAM617 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM617 RNA is designated SEQ ID:3328, and is provided hereinbelow with reference to the sequence listing part.

[25974] VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM617 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25975] VGAM617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM617 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25976] The complementary binding of VGAM617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM617 host target RNA into VGAM617 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[25977] It is appreciated that VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM617 host target genes. The mRNA of each one of this plurality of VGAM617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM617 RNA, herein designated VGAM RNA, and which when bound by VGAM617 RNA causes inhibition of translation of respective one or more VGAM617 host target proteins.

[25978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM617 gene, herein designated VGAM GENE, on one or more VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25979] It is yet further appreciated that a function of VGAM617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM617 include diagnosis, prevention and treatment of viral infection by Xestia C-nigrum Granulovirus. Specific functions, and accordingly utilities, of VGAM617 correlate with, and may be deduced from, the identity of the host target genes which VGAM617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25980] Nucleotide sequences of the VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM617 are further described hereinbelow with reference to Table 1.

[25981] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM617 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM617 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[25982] As mentioned hereinabove with reference to Fig. 1, a function of VGAM617 gene, herein designated VGAM is inhibition of expression of VGAM617 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM617 correlate with, and may be deduced from, the identity of the target genes which VGAM617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25983] LOC154442 (Accession XM\_098536) is a VGAM617 host target gene. LOC154442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154442 BINDING SITE, designated SEQ ID:41706, to the nucleotide sequence of VGAM617 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3328.

[25984] A function of VGAM617 is therefore inhibition of LOC154442 (Accession XM\_098536). Accordingly, utilities of VGAM617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154442. LOC51279 (Accession NM\_016546) is another VGAM617 host target gene. LOC51279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18613, to the nucleotide sequence of VGAM617 RNA, herein designated VGAM RNA, also designated SEQ ID:3328.

[25985] Another function of VGAM617 is therefore inhibition of LOC51279 (Accession NM\_016546). Accordingly, utilities of VGAM617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. LOC51336 (Accession NM\_016646) is another VGAM617 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51336, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18760, to the nucleotide sequence of VGAM617 RNA, herein designated VGAM RNA, also designated SEQ ID:3328.

[25986] Another function of VGAM617 is therefore inhibition of LOC51336 (Accession NM\_016646). Accordingly, utilities of VGAM617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 618 (VGAM618) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[25987] VGAM618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM618 was detected is described hereinabove with reference to Figs. 1–8.

[25988] VGAM618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Oral Papillo–

mavirus. VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[25989] VGAM618 gene encodes a VGAM618 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM618 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM618 precursor RNA is designated SEQ ID:604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:604 is located at position 4111 relative to the genome of Rabbit Oral Papillomavirus.

[25990] VGAM618 precursor RNA folds onto itself, forming VGAM618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25991] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM618 folded precursor RNA into VGAM618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM618 RNA is designated SEQ ID:3329, and is provided hereinbelow with reference to the sequence listing part.

[25992] VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM618 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[25993] VGAM618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM618 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM618 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[25994] The complementary binding of VGAM618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM618 host target RNA into VGAM618 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[25995] It is appreciated that VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM618 host target genes. The mRNA of each one of this plurality of VGAM618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM618 RNA, herein designated VGAM RNA, and which when bound by VGAM618 RNA causes inhibition of translation of respective one or more VGAM618 host target proteins.

[25996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM618 gene, herein designated VGAM GENE, on one or more VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[25997] It is yet further appreciated that a function of VGAM618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM618 include diagnosis, prevention and treatment of viral infection by Rabbit Oral Papillomavirus. Specific functions, and accordingly utilities, of VGAM618 correlate with, and may be deduced from, the identity of the host target genes which VGAM618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[25998] Nucleotide sequences of the VGAM618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM618 are further described hereinbelow with reference to Table 1.

[25999] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM618 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26000] As mentioned hereinabove with reference to Fig. 1, a function of VGAM618 gene, herein designated VGAM is inhibition of expression of VGAM618 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM618 correlate with, and may be deduced from, the identity of the target genes which VGAM618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26001] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM\_003778) is a VGAM618 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4

BINDING SITE, designated SEQ ID:9857, to the nucleotide sequence of VGAM618 RNA, herein designated VGAM RNA, also designated SEQ ID:3329.

[26002] A function of VGAM618 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM\_003778). Accordingly, utilities of VGAM618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Macrophage Scavenger Receptor 1 (MSR1, Accession NM\_002445) is another VGAM618 host target gene. MSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE, designated SEQ ID:8284, to the nucleotide sequence of VGAM618 RNA, herein designated VGAM RNA, also designated SEQ ID:3329.

[26003] Another function of VGAM618 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM\_002445), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM618 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM176. Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM\_020708) is another VGAM618 host target gene. SLC12A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:21854, to the nucleotide sequence of VGAM618 RNA, herein designated VGAM RNA, also designated SEQ ID:3329.

[26004] Another function of VGAM618 is therefore inhibition of Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM\_020708). Accordingly, utilities of VGAM618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic

Address Messenger 619 (VGAM619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26005] VGAM619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM619 was detected is described hereinabove with reference to Figs. 1–8.

[26006] VGAM619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26007] VGAM619 gene encodes a VGAM619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM619 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM619 precursor RNA is designated SEQ ID:605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:605 is located at position 8778 relative to the genome of Hepatitis GB Virus C.

[26008] VGAM619 precursor RNA folds onto itself, forming VGAM619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26009] An enzyme complex designated DICER COMPLEX, `dices` the VGAM619 folded precursor RNA into VGAM619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM619 RNA is designated SEQ ID:3330, and is provided hereinbelow with reference to the sequence listing part.

[26010] VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM619 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM619 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26011] VGAM619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM619 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM619 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26012] The complementary binding of VGAM619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM619 host target RNA into VGAM619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26013] It is appreciated that VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM619 host target genes. The mRNA of each one of this plurality of VGAM619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM619 RNA, herein designated VGAM RNA, and which when bound by VGAM619 RNA causes inhibition of translation of respective one or more VGAM619 host target proteins.

[26014] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM619 gene, herein designated VGAM GENE, on one or more VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26015] It is yet further appreciated that a function of VGAM619 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM619 correlate with, and may be deduced from, the identity of the

host target genes which VGAM619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26016] Nucleotide sequences of the VGAM619 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM619 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM619 are further described hereinbelow with reference to Table 1.

[26017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM619 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM619 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26018] As mentioned hereinabove with reference to Fig. 1, a function of VGAM619 gene, herein designated VGAM is inhibition of expression of VGAM619 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM619 correlate with, and may be deduced from, the identity of the target genes which VGAM619

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26019] Solute Carrier Family 21 (organic anion transporter), Member 11 (SLC21A11, Accession XM\_035268) is a VGAM619 host target gene. SLC21A11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC21A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A11 BINDING SITE, designated SEQ ID:32207, to the nucleotide sequence of VGAM619 RNA, herein designated VGAM RNA, also designated SEQ ID:3330.

[26020] A function of VGAM619 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 11 (SLC21A11, Accession XM\_035268). Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A11. LOC151429 (Accession XM\_098059) is another VGAM619 host target gene. LOC151429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151429, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:41341, to the nucleotide sequence of VGAM619 RNA, herein designated VGAM RNA, also designated SEQ ID:3330.

[26021] Another function of VGAM619 is therefore inhibition of LOC151429 (Accession XM\_098059). Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429. LOC153572 (Accession XM\_098392) is another VGAM619 host target gene. LOC153572 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153572 BINDING SITE, designated SEQ ID:41639, to the nucleotide sequence of VGAM619 RNA, herein designated VGAM RNA, also designated SEQ ID:3330.

[26022] Another function of VGAM619 is therefore inhibition of LOC153572 (Accession XM\_098392). Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153572. LOC155340 (Accession XM\_055725) is another VGAM619 host target gene. LOC155340 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155340 BINDING SITE, designated SEQ ID:36318, to the nucleotide sequence of VGAM619 RNA, herein designated VGAM RNA, also designated SEQ ID:3330.

[26023] Another function of VGAM619 is therefore inhibition of LOC155340 (Accession XM\_055725). Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155340. LOC93052 (Accession XM\_048905) is another VGAM619 host target gene. LOC93052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93052 BINDING SITE, designated SEQ ID:35302, to the nucleotide sequence of VGAM619 RNA, herein designated

VGAM RNA, also designated SEQ ID:3330.

[26024] Another function of VGAM619 is therefore inhibition of LOC93052 (Accession XM\_048905). Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93052. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 620 (VGAM620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26025] VGAM620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM620 was detected is described hereinabove with reference to Figs. 1–8.

[26026] VGAM620 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26027] VGAM620 gene encodes a VGAM620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM620 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM620 precursor RNA is designated SEQ ID:606, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:606 is located at position 3307 relative to the genome of Hepatitis GB Virus C.

[26028] VGAM620 precursor RNA folds onto itself, forming VGAM620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26029] An enzyme complex designated DICER COMPLEX, `dices` the VGAM620 folded precursor RNA into VGAM620 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM620 RNA is designated SEQ ID:3331, and is provided hereinbelow with reference to the sequence listing part.

[26030] VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM620 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[26031] VGAM620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM620 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[26032] The complementary binding of VGAM620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM620 host target RNA into VGAM620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26033] It is appreciated that VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM620 host target genes. The mRNA of

each one of this plurality of VGAM620 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM620 RNA, herein designated VGAM RNA, and which when bound by VGAM620 RNA causes inhibition of translation of respective one or more VGAM620 host target proteins.

[26034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM620 gene, herein designated VGAM GENE, on one or more VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[26035] It is yet further appreciated that a function of VGAM620 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM620 correlate with, and may be deduced from, the identity of the host target genes which VGAM620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26036] Nucleotide sequences of the VGAM620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM620 are further described hereinbelow with reference to Table 1.

[26037] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM620 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM620 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[26038] As mentioned hereinabove with reference to Fig. 1, a function of VGAM620 gene, herein designated VGAM is inhibition of expression of VGAM620 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM620 correlate with, and may be deduced from, the identity of the target genes which VGAM620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26039] FLJ10781 (Accession NM\_018215) is a VGAM620 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20136, to the nucleotide sequence of VGAM620 RNA, herein designated VGAM RNA, also designated SEQ ID:3331.

[26040] A function of VGAM620 is therefore inhibition of FLJ10781 (Accession NM\_018215). Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10781. KIAA0182 (Accession XM\_050495) is another VGAM620 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35647, to the nucleotide sequence of VGAM620 RNA, herein designated VGAM RNA, also designated SEQ ID:3331.

[26041] Another function of VGAM620 is therefore inhibition of KIAA0182 (Accession XM\_050495). Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. LOC151610 (Accession XM\_087245) is another VGAM620 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:39135, to

the nucleotide sequence of VGAM620 RNA, herein designated VGAM RNA, also designated SEQ ID:3331.

[26042] Another function of VGAM620 is therefore inhibition of LOC151610 (Accession XM\_087245). Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151610. LOC157958 (Accession XM\_088431) is another VGAM620 host target gene. LOC157958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157958 BINDING SITE, designated SEQ ID:39685, to the nucleotide sequence of VGAM620 RNA, herein designated VGAM RNA, also designated SEQ ID:3331.

[26043] Another function of VGAM620 is therefore inhibition of LOC157958 (Accession XM\_088431). Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157958. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 621 (VGAM621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26044] VGAM621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM621 was detected is described hereinabove with reference to Figs. 1–8.

[26045] VGAM621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26046] VGAM621 gene encodes a VGAM621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM621 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM621 precursor RNA is designated SEQ ID:607, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:607 is located at position 757 relative to the genome of Hepatitis GB Virus C.

[26047] VGAM621 precursor RNA folds onto itself, forming VGAM621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26048] An enzyme complex designated DICER COMPLEX, `dices` the VGAM621 folded precursor RNA into VGAM621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM621 RNA is designated SEQ ID:3332, and is provided hereinbelow with reference to the sequence listing part.

[26049] VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM621 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM621 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26050] VGAM621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM621 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26051] The complementary binding of VGAM621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM621 host target RNA into VGAM621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26052] It is appreciated that VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM621 host target genes. The mRNA of each one of this plurality of VGAM621 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM621 RNA, herein designated VGAM RNA, and which when bound by VGAM621 RNA causes inhibition of translation of respective one or more VGAM621 host target proteins.

[26053] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM621 gene, herein designated VGAM GENE, on one or more VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26054] It is yet further appreciated that a function of VGAM621 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM621 correlate with, and may be deduced from, the identity of the

host target genes which VGAM621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26055] Nucleotide sequences of the VGAM621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM621 are further described hereinbelow with reference to Table 1.

[26056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM621 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26057] As mentioned hereinabove with reference to Fig. 1, a function of VGAM621 gene, herein designated VGAM is inhibition of expression of VGAM621 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM621 correlate with, and may be deduced from, the identity of the target genes which VGAM621

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26058] poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM\_002568) is a VGAM621 host target gene. PABPC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PABPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC1 BINDING SITE, designated SEQ ID:8418, to the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, also designated SEQ ID:3332.

[26059] A function of VGAM621 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM\_002568), a gene which involves in cytoplasmic regulatory processes of mRNA metabolism. Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PABPC1. The function of PABPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280. Polymerase (DNA directed) Sigma (POLS, Accession NM\_006999) is another VGAM621 host

target gene. POLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLS BINDING SITE, designated SEQ ID:13864, to the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, also designated SEQ ID:3332.

[26060] Another function of VGAM621 is therefore inhibition of Polymerase (DNA directed) Sigma (POLS, Accession NM\_006999), a gene which is necessary for chromosome segregation. Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLS. The function of POLS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM106.CD36L2 (Accession NM\_005506) is another VGAM621 host target gene. CD36L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CD36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CD36L2 BINDING SITE, designated SEQ ID:12021, to the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, also designated SEQ ID:3332.

[26061] Another function of VGAM621 is therefore inhibition of CD36L2 (Accession NM\_005506). Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD36L2. Protein-O-mannosyltransferase 1 (POMT1, Accession NM\_007171) is another VGAM621 host target gene. POMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:14015, to the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, also designated SEQ ID:3332.

[26062] Another function of VGAM621 is therefore inhibition of Protein-O-mannosyltransferase 1 (POMT1, Accession NM\_007171). Accordingly, utilities of VGAM621 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1. Rab11-FIP3 (Accession NM\_014700) is another VGAM621 host target gene. Rab11-FIP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP3 BINDING SITE, designated SEQ ID:16225, to the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, also designated SEQ ID:3332.

[26063] Another function of VGAM621 is therefore inhibition of Rab11-FIP3 (Accession NM\_014700). Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 622 (VGAM622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26064] VGAM622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM622 was detected is described hereinabove with reference to Figs. 1–8.

[26065] VGAM622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26066] VGAM622 gene encodes a VGAM622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM622 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM622 precursor RNA is designated SEQ ID:608, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:608 is located at position 6041 relative to the genome of Hepatitis GB Virus C.

[26067] VGAM622 precursor RNA folds onto itself, forming VGAM622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26068] An enzyme complex designated DICER COMPLEX, `dices` the VGAM622 folded precursor RNA into VGAM622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM622 RNA is designated SEQ ID:3333, and is provided hereinbelow with reference to the sequence listing part.

[26069] VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM622 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[26070] VGAM622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM622 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM622 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26071] The complementary binding of VGAM622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM622 host target RNA into VGAM622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26072] It is appreciated that VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM622 host target genes. The mRNA of each one of this plurality of VGAM622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM622 RNA, herein designated VGAM RNA, and which when bound by VGAM622 RNA causes inhibition of translation of respective one or more VGAM622 host target proteins.

[26073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM622 gene, herein designated VGAM GENE, on one or more VGAM622 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26074] It is yet further appreciated that a function of VGAM622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM622 correlate with, and may be deduced from, the identity of the host target genes which VGAM622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26075] Nucleotide sequences of the VGAM622 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM622 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM622 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM622 are further  
described hereinbelow with reference to Table 1.

[26076] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM622 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM622 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[26077] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM622 gene, herein designated VGAM is  
inhibition of expression of VGAM622 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM622 correlate with, and may be deduced  
from, the identity of the target genes which VGAM622  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[26078] Potassium Voltage-gated Channel, KQT-like Subfamily,  
Member 1 (KCNQ1, Accession NM\_000218) is a VGAM622

host target gene. KCNQ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNQ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ1 BINDING SITE, designated SEQ ID:5722, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26079] A function of VGAM622 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM\_000218), a gene which probably important in cardiac repolarization. associates with kcne1 (mink) to form the i(k<sub>s</sub>) cardiac potassium current. elicits a rapidly activating, k(+)-selective outward current. muscarinic agonist oxotremorine-m strongly suppresses kcnq1/kcne1 current in cho cells in which cloned kcnq1/kcne1 channels were coexpressed with m1 muscarinic receptors. may associate also with kcne3 (mirp2) to form the potassium channel that is important for cyclic amp-stimulated intestinal secretion of chloride  
io TISSUE:abondantly expressed in heart, pancreas, prostate, kidney, small intestine and peripheral blood

leukocytes. less abundant in placenta, lung, spleen, colon, thymus, testis and ovaries. Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ1. The function of KCNQ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM339. Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM\_000635) is another VGAM622 host target gene. RFX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX2 BINDING SITE, designated SEQ ID:6270, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26080] Another function of VGAM622 is therefore inhibition of Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM\_000635), a gene which acts as a dimer to regulate the expression of many genes. Accordingly, utilities of VGAM622 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with RFX2. The function of RFX2 has been established by previous studies. Pugliatti et al. (1992) noted that the expression of HLA class II genes (DR, DQ, and DP) is controlled primarily by cis-acting DNA motifs located within the 150 bp upstream of the genes and in particular by 2 highly conserved sequences, the X and Y boxes. Several protein factors bind to these cis-acting sequences. RFX is of special interest since a specific defect in its binding to target DNA sequence has been observed in patients with HLA class II deficient combined immunodeficiency (see OMIM Ref. No. 209920). Overexpression of RFX in transfected cells transactivates an HLA class II promoter, and antisense RNA expressed in transfected cells inhibits the expression of HLA-DR genes. A closely related form of RFX, referred to as RFX2, has also been isolated. The RFX1 (OMIM Ref. No. 600006) gene product is a transactivator of the human hepatitis B viral enhancer I. Reith et al. (1994) commented that the RFX family members, particularly RFX1 and RFX3 (OMIM Ref. No. 601337), constitute the nuclear complexes referred to previously as enhancer factor C (EF-C), EP, and methylation-dependent DNA-binding protein (MDBP), or rpL30-alpha. Reith et al.

(1994) identified and cloned 3 members of this gene family from both human and mouse using lambda gt11 cDNA libraries. The gene encoding human RFX2 encodes a 721-amino acid polypeptide. Homology between the 3 RFX proteins is restricted largely to 5 conserved regions, including the 2 domains required for DNA binding and dimerization. Reith et al. (1994) found that RFX1, RFX2, and RFX3 have similar DNA-binding specificities. The RFX monomers can heterodimerize both in vivo and in vitro, but all 3 are capable of binding DNA as monomers. They showed that the RFX2 transcript is particularly elevated in mouse testis.

[26081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26082] Pugliatti, L.; Derre, J.; Berger, R.; Ucla, C.; Reith, W.; Mach, B. : The genes for MHC class II regulatory factors RFX1 and RFX2 are located on the short arm of chromosome 19. Genomics 13: 1307–1310, 1992. ; and

[26083] Reith, W.; Ucla, C.; Barras, E.; Gaud, A.; Durand, B.; Herrero-Sanchez, C.; Kobr, M.; Mach, B. : RFX1, a transactivator of hepatitis B virus enhancer I, belongs to a novel family of hom.

[26084] Further studies establishing the function and utilities of RFX2 are found in John Hopkins OMIM database record ID 142765, and in cited publications numbered 4745–4747 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FK506 Binding Protein 5 (FKBP5, Accession NM\_004117) is another VGAM622 host target gene. FKBP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP5 BINDING SITE, designated SEQ ID:10323, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26085] Another function of VGAM622 is therefore inhibition of FK506 Binding Protein 5 (FKBP5, Accession NM\_004117). Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP5. MGC20576 (Accession NM\_144691) is another VGAM622 host target gene. MGC20576 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

MGC20576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20576 BINDING SITE, designated SEQ ID:29510, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26086] Another function of VGAM622 is therefore inhibition of MGC20576 (Accession NM\_144691). Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20576. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM\_052567) is another VGAM622 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35987, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26087] Another function of VGAM622 is therefore inhibition of

Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM\_052567). Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446) is another VGAM622 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11927, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26088] Another function of VGAM622 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM\_005446). Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. RA-GEF-2 (Accession NM\_016340) is another VGAM622 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18462, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26089] Another function of VGAM622 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. LOC197358 (Accession XM\_113872) is another VGAM622 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42507, to the nucleotide sequence of VGAM622 RNA, herein designated VGAM RNA, also designated SEQ ID:3333.

[26090] Another function of VGAM622 is therefore inhibition of LOC197358 (Accession XM\_113872). Accordingly, utilities

of VGAM622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 623 (VGAM623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26091] VGAM623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM623 was detected is described hereinabove with reference to Figs. 1–8.

[26092] VGAM623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26093] VGAM623 gene encodes a VGAM623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM623 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM623 precursor RNA is designated SEQ ID:609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:609 is located at position 1610 relative to the genome of Hepatitis GB Virus C.

[26094] VGAM623 precursor RNA folds onto itself, forming VGAM623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM623 folded precursor RNA into VGAM623 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM623 RNA is designated SEQ ID:3334, and

is provided hereinbelow with reference to the sequence listing part.

[26096] VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM623 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26097] VGAM623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM623 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26098] The complementary binding of VGAM623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM623 host target RNA into VGAM623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26099] It is appreciated that VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM623 host target genes. The mRNA of each one of this plurality of VGAM623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM623 RNA, herein designated VGAM RNA, and which when bound by VGAM623 RNA causes inhibition of translation of respective one or more VGAM623 host target proteins.

[26100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM623 gene, herein designated VGAM GENE, on one or more VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26101] It is yet further appreciated that a function of VGAM623 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM623 correlate with, and may be deduced from, the identity of the host target genes which VGAM623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26102] Nucleotide sequences of the VGAM623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM623 are further described hereinbelow with reference to Table 1.

[26103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM623 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26104] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM623 gene, herein designated VGAM is inhibition of expression of VGAM623 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM623 correlate with, and may be deduced from, the identity of the target genes which VGAM623 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26105] Chloride Channel 7 (CLCN7, Accession NM\_001287) is a VGAM623 host target gene. CLCN7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN7 BINDING SITE, designated SEQ ID:6963, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26106] A function of VGAM623 is therefore inhibition of Chloride Channel 7 (CLCN7, Accession NM\_001287), a gene which is voltage-gated chloride channel. Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN7. The function of CLCN7 has been established by previous

studies. Cleiren et al. (2001) reported 7 different mutations in the CLCN7 gene among 12 autosomal dominant osteopetrosis type II (OPTA2; 166600) families analyzed. Among these families was the Danish family initially linked to chromosome 1p21. Additionally, 1 patient with the severe autosomal recessive infantile form of osteopetrosis (OPTB1) was identified as being homozygous for a CLCN7 mutation. The authors hypothesized that OPTA2 reflects a dominant negative effect, since loss-of-function mutations in CLCN7 do not cause abnormalities in heterozygous individuals. Because some OPTB1 patients have mutations in both copies of the CLCN7 gene, it appears that OPTA2 is allelic with a subset of OPTB1 cases. In a patient with autosomal recessive infantile malignant osteopetrosis (OMIM Ref. No. 259700), Kornak et al. (2001) identified compound heterozygosity for a C-to-T transition at codon 555 of the CLCN7 gene, leading to gln-to-ter substitution, and a G-to-A transition at nucleotide 2285, leading to an arg762-to-gln substitution (602727.0002). The arg762-to-gln substitution abolished a positive charge within the conserved CBS2 domain of CCLN7. To investigate whether the mutations affected protein expression, fibroblasts were analyzed by Western

blot analysis and immunofluorescence. In contrast to control cells, CLCN7 protein could not be detected in the fibroblasts from the patient. Animal model experiments lend further support to the function of CLCN7. Kornak et al. (2001) observed that mice with targeted disruption of the *Clcn7* gene (*Clcn7*  $-/-$ ) had severe osteopetrosis and retinal degeneration. Although osteoclasts were present in normal numbers, they failed to resorb bone because they could not acidify the extracellular resorption lacuna. *Clcn7* was found to reside in late endosomal and lysosomal compartments. In osteoclasts it was highly expressed in the ruffled membrane, formed by the fusion of H(+) ATPase-containing vesicles, that secretes protons into the lacuna. Based on the similarity between the mouse model and human infantile malignant osteopetrosis (OMIM Ref. No. 259700), Kornak et al. (2001) searched for mutations in the human CLCN7 gene in patients with the disease. They identified CLCN7 mutations in 1 of 12 patients with infantile malignant osteopetrosis. The authors concluded that CLCN7 provides the chloride conductance required for an efficient proton pumping by the H(+) ATPase of the osteoclast ruffled membrane.

[26107] It is appreciated that the abovementioned animal model

for CLCN7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26109] Cleiren, E.; Benichou, O.; Van Hul, E.; Gram, J.; Bollerslav, J.; Singer, F. R.; Beaverson, K.; Aledo, A.; Whyte, M. Genet. 10: 2861-2867, 2001.  
; and

[26110] Kornak, U.; Kasper, D.; Bosl, M. R.; Kaiser, E.; Schweizer, M.; Schulz, A.; Friedrich, W.; Delling, G.; Jentsch, T. J. : Loss of the ClC-7 chloride channel leads to osteopetrosis in mi.

[26111] Further studies establishing the function and utilities of CLCN7 are found in John Hopkins OMIM database record ID 602727, and in cited publications numbered 8588, 859 and 11076 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. N-acetylgalactosaminidase, Alpha- (NAGA, Acces-

sion NM\_000262) is another VGAM623 host target gene. NAGA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE, designated SEQ ID:5798, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26112] Another function of VGAM623 is therefore inhibition of N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM\_000262). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA. PDGFA Associated Protein 1 (PDAP1, Accession XM\_166484) is another VGAM623 host target gene. PDAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDAP1 BINDING SITE, designated SEQ ID:44420, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3334.

[26113] Another function of VGAM623 is therefore inhibition of PDGFA Associated Protein 1 (PDAP1, Accession XM\_166484). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDAP1. Stanniocalcin 1 (STC1, Accession NM\_003155) is another VGAM623 host target gene. STC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC1 BINDING SITE, designated SEQ ID:9133, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26114] Another function of VGAM623 is therefore inhibition of Stanniocalcin 1 (STC1, Accession NM\_003155), a gene which stimulates renal phosphate reabsorption, and could therefore prevent hypercalcemia. Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC1. The function of STC1 has been established by previous stud-

ies. Stanniocalcin (STC) is a calcium-regulated hormone in bony fishes. The hormone was so named because it is synthesized by the corpuscles of Stannius, endocrine glands that are associated with the kidneys of all fishes with a bony skeleton. The primary function of STC in fishes is the prevention of hypercalcemia; Olsen et al. (1996) noted that a rise in serum calcium levels is the primary stimulus for secretion. Upon release into the circulation, STC lowers calcium transport by the gills, thereby reducing its rate of influx from the environment into the extracellular compartment. A second equally important action of STC is stimulation of phosphate reabsorption by renal proximal tubules. The consequence of this renal effect is increased levels of plasma phosphate, which combines with excess calcium and promotes its disposal into bone and scales. Wagner et al. (1995) found evidence of STC immunoreactivity in human kidney and serum, suggesting the existence of the hormone in mammals. Olsen et al. (1996) isolated a human cDNA clone encoding the mammalian homolog of STC. Human STC was found to be 247 amino acids long and to share 73% amino acid sequence similarity with fish STC. Polyclonal antibodies to recombinant human STC localized to a distinct cell type in

the nephron tubule, suggesting kidney as a possible site of synthesis. Recombinant human STC inhibited the gill transport of calcium when administered to fish and stimulated renal phosphate reabsorption in the rat.

[26115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26116] Olsen, H. S.; Cepeda, M. A.; Zhang, Q.-Q.; Rosen, C. A.; Vozzolo, B. L.; Wagner, G. F. : Human stanniocalcin: a possible hormonal regulator of mineral metabolism. *Proc. Nat. Acad. Sci.* 93: 1792–1796, 1996. ; and

[26117] Wagner, G. F.; Guiraudon, C. C.; Milliken, C.; Copp, D. H. : Immunological and biological evidence for a stanniocalcin-like hormone in human kidney. *Proc. Nat. Acad. Sci.* 92: 1871–1875.

[26118] Further studies establishing the function and utilities of STC1 are found in John Hopkins OMIM database record ID 601185, and in cited publications numbered 9509–9514, 963 and 9834 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Surfeit 5 (SURF5, Accession NM\_006752) is another VGAM623 host target gene. SURF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by SURF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:13606, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26119] Another function of VGAM623 is therefore inhibition of Surfeit 5 (SURF5, Accession NM\_006752). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5. Chromosome 11 Open Reading Frame 14 (C11orf14, Accession NM\_020645) is another VGAM623 host target gene. C11orf14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf14 BINDING SITE, designated SEQ ID:21808, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26120] Another function of VGAM623 is therefore inhibition of

Chromosome 11 Open Reading Frame 14 (C11orf14, Accession NM\_020645). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf14. ERp44 (Accession XM\_088476) is another VGAM623 host target gene. ERp44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39723, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26121] Another function of VGAM623 is therefore inhibition of ERp44 (Accession XM\_088476). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. KIAA1091 (Accession XM\_045750) is another VGAM623 host target gene. KIAA1091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1091 BINDING SITE, designated SEQ ID:34538, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26122] Another function of VGAM623 is therefore inhibition of KIAA1091 (Accession XM\_045750). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1091. Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814) is another VGAM623 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BINDING SITE, designated SEQ ID:13687, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26123] Another function of VGAM623 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814). Accordingly, utili-

ties of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144) is another VGAM623 host target gene. RAB6C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB6C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6C BINDING SITE, designated SEQ ID:25832, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26124] Another function of VGAM623 is therefore inhibition of RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6C. WD Repeat Domain 9 (WDR9, Accession NM\_033656) is another VGAM623 host target gene. WDR9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR9 BINDING SITE, designated SEQ ID:27389, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26125] Another function of VGAM623 is therefore inhibition of WD Repeat Domain 9 (WDR9, Accession NM\_033656). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR9. LOC143943 (Accession XM\_096504) is another VGAM623 host target gene. LOC143943 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143943 BINDING SITE, designated SEQ ID:40381, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26126] Another function of VGAM623 is therefore inhibition of LOC143943 (Accession XM\_096504). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143943. LOC147976 (Accession XM\_085980) is another VGAM623 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38426, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26127] Another function of VGAM623 is therefore inhibition of LOC147976 (Accession XM\_085980). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC150157 (Accession XM\_097823) is another VGAM623 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41141, to the nucleotide sequence of VGAM623 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3334.

[26128] Another function of VGAM623 is therefore inhibition of LOC150157 (Accession XM\_097823). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC157653 (Accession XM\_088353) is another VGAM623 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39631, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26129] Another function of VGAM623 is therefore inhibition of LOC157653 (Accession XM\_088353). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC256158 (Accession XM\_175125) is another VGAM623 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46635, to the nucleotide sequence of VGAM623 RNA, herein designated VGAM RNA, also designated SEQ ID:3334.

[26130] Another function of VGAM623 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 624 (VGAM624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26131] VGAM624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM624 was detected is described hereinabove with reference to Figs. 1–8.

[26132] VGAM624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C.

VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26133] VGAM624 gene encodes a VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM624 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM624 precursor RNA is designated SEQ ID:610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:610 is located at position 4971 relative to the genome of Hepatitis GB Virus C.

[26134] VGAM624 precursor RNA folds onto itself, forming VGAM624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26135] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM624 folded precursor RNA into VGAM624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM624 RNA is designated SEQ ID:3335, and is provided hereinbelow with reference to the sequence listing part.

[26136] VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM624 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26137] VGAM624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM624 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26138] The complementary binding of VGAM624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM624 host target RNA into VGAM624 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26139] It is appreciated that VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM624 host target genes. The mRNA of each one of this plurality of VGAM624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM624 RNA, herein designated VGAM RNA, and which when bound by VGAM624 RNA causes inhibition of translation of respective one or more VGAM624 host target proteins.

[26140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM624 gene, herein designated VGAM GENE, on one or more VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26141] It is yet further appreciated that a function of VGAM624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM624 correlate with, and may be deduced from, the identity of the host target genes which VGAM624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26142] Nucleotide sequences of the VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM624 are further described hereinbelow with reference to Table 1.

- [26143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM624 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [26144] As mentioned hereinabove with reference to Fig. 1, a function of VGAM624 gene, herein designated VGAM is inhibition of expression of VGAM624 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM624 correlate with, and may be deduced from, the identity of the target genes which VGAM624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [26145] Carbonic Anhydrase II (CA2, Accession NM\_000067) is a VGAM624 host target gene. CA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA2 BINDING SITE, designated SEQ ID:5513, to the nucleotide sequence of

VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26146] A function of VGAM624 is therefore inhibition of Carbonic Anhydrase II (CA2, Accession NM\_000067). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA2. Galactosylceramidase (Krabbe disease) (GALC, Accession NM\_000153) is another VGAM624 host target gene. GALC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALC BINDING SITE, designated SEQ ID:5662, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26147] Another function of VGAM624 is therefore inhibition of Galactosylceramidase (Krabbe disease) (GALC, Accession NM\_000153), a gene which hydrolyses the galactose ester bonds of galactosylceramide, galactosylsphingosine, lactosylceramide, and monogalactosyldiglyceride. Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with GALC. The function of GALC has been established by previous studies. Sakai et al. (1994) identified a glu369-to-ter nonsense mutation in a patient with typical Krabbe disease (606890.0001). Rafi et al. (1995) described a mutation of the GALC gene leading to the loss of exons 11–17. The deletion was associated with a C-to-T transition at position 502 of the cDNA leading to replacement of arginine by cysteine; see 606890.0002. Expression of the 502/del mutation in COS-1 cells resulted in no measurable GALC activity above that in mock transfected cells. Rafi et al. (1995) indicated that, while not yet confirmed by expression studies, 3 missense mutations and 1 single nucleotide insertion had been identified in patients with infantile Krabbe disease. Animal model experiments lend further support to the function of GALC. Victoria et al. (1996) found that the disease-causing mutation in the canine GALC gene was demonstrated to be an A-to-C transversion at cDNA position 473 (Y158S). Luzi et al. (1997) found that the mutation causing GLD in the rhesus monkey was a deletion of AC corresponding to cDNA positions 387 and 388 in exon 4. This resulted in a frameshift and stop codon after 46 nucleotides. Using an engineered sense primer and an antisense primer from in-

tron 4, Luzi et al. (1997) developed a rapid method to detect the GALC mutation. When 45 monkeys from 1 colony were tested, 22 were found to be carriers. The availability of this nonhuman primate model of GLD provides unique opportunities to evaluate treatment for this severe disease.

[26148] It is appreciated that the abovementioned animal model for GALC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26149] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26150] Rafi, M. A.; Luzi, P.; Chen, Y. Q.; Wenger, D. A. : A large deletion together with a point mutation in the GALC gene is a common mutant allele in patients with infantile Krabbe disease. Hum. Molec. Genet. 4: 1285–1289, 1995.  
; and

[26151] Victoria, T.; Rafi, M. A.; Wenger, D. A. : Cloning of the canine GALC cDNA and identification of the mutation causing globoid cell leukodystrophy in West Highland White and Cairn terrie.

[26152] Further studies establishing the function and utilities of

GALC are found in John Hopkins OMIM database record ID 606890, and in cited publications numbered 9217–5396, 9218–9219, 5397–5401, 9230, 9594–923 and 9590–9593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoinositide–3–kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982) is another VGAM624 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30604, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26153] Another function of VGAM624 is therefore inhibition of Phosphoinositide–3–kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Protein Tyrosine Phosphatase, Re–

ceptor Type, C (PTPRC, Accession NM\_002838) is another VGAM624 host target gene. PTPRC BINDING SITE1 and PTPRC BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE1 and PTPRC BINDING SITE2, designated SEQ ID:8721 and SEQ ID:28147 respectively, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26154] Another function of VGAM624 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_002838). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. ABLIM (Accession NM\_006720) is another VGAM624 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1

and ABLIM BINDING SITE2, designated SEQ ID:13547 and SEQ ID:8114 respectively, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26155] Another function of VGAM624 is therefore inhibition of ABLIM (Accession NM\_006720). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. DKFZP564A1164 (Accession XM\_048304) is another VGAM624 host target gene. DKFZP564A1164 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564A1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564A1164 BINDING SITE, designated SEQ ID:35153, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26156] Another function of VGAM624 is therefore inhibition of DKFZP564A1164 (Accession XM\_048304). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564A1164. DKFZP564K0822 (Accession XM\_168378) is another VGAM624 host target gene. DKFZP564K0822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564K0822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564K0822 BINDING SITE, designated SEQ ID:45141, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26157] Another function of VGAM624 is therefore inhibition of DKFZP564K0822 (Accession XM\_168378). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0822. FLJ14735 (Accession NM\_032832) is another VGAM624 host target gene. FLJ14735 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14735 BINDING SITE, designated SEQ ID:26609, to the

nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26158] Another function of VGAM624 is therefore inhibition of FLJ14735 (Accession NM\_032832). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14735. G4 (Accession XM\_165712) is another VGAM624 host target gene. G4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G4 BINDING SITE, designated SEQ ID:43734, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26159] Another function of VGAM624 is therefore inhibition of G4 (Accession XM\_165712). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G4. Potassium Inwardly-rectifying Channel, Subfamily J, Member 14 (KCNJ14, Accession NM\_013348) is another VGAM624 host target gene. KCNJ14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by KCNJ14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ14 BINDING SITE, designated SEQ ID:14994, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26160] Another function of VGAM624 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 14 (KCNJ14, Accession NM\_013348). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ14. KIAA0470 (Accession NM\_014812) is another VGAM624 host target gene. KIAA0470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0470 BINDING SITE, designated SEQ ID:16776, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26161] Another function of VGAM624 is therefore inhibition of

KIAA0470 (Accession NM\_014812). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0470. PRSC (Accession NM\_006587) is another VGAM624 host target gene. PRSC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSC BINDING SITE, designated SEQ ID:13349, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26162] Another function of VGAM624 is therefore inhibition of PRSC (Accession NM\_006587). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSC. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131) is another VGAM624 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9100, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26163] Another function of VGAM624 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM\_015993) is another VGAM624 host target gene. TM4SF11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM4SF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF11 BINDING SITE, designated SEQ ID:18086, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26164] Another function of VGAM624 is therefore inhibition of Transmembrane 4 Superfamily Member 11 (plasmolipin)

(TM4SF11, Accession NM\_015993). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF11. TRIP-Br2 (Accession NM\_014755) is another VGAM624 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16485, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26165] Another function of VGAM624 is therefore inhibition of TRIP-Br2 (Accession NM\_014755). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. Ubiquitination Factor E4B (UFD2 homolog, yeast) (UBE4B, Accession NM\_006048) is another VGAM624 host target gene. UBE4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of UBE4B BINDING SITE, designated SEQ ID:12682, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26166] Another function of VGAM624 is therefore inhibition of Ubiquitination Factor E4B (UFD2 homolog, yeast) (UBE4B, Accession NM\_006048). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4B. LOC115219 (Accession XM\_055499) is another VGAM624 host target gene. LOC115219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36280, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26167] Another function of VGAM624 is therefore inhibition of LOC115219 (Accession XM\_055499). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC115219. LOC126526 (Accession XM\_059053) is another VGAM624 host target gene. LOC126526 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126526, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126526 BINDING SITE, designated SEQ ID:36846, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26168] Another function of VGAM624 is therefore inhibition of LOC126526 (Accession XM\_059053). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126526. LOC143286 (Accession XM\_096412) is another VGAM624 host target gene. LOC143286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, designated SEQ ID:40355, to

the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26169] Another function of VGAM624 is therefore inhibition of LOC143286 (Accession XM\_096412). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286. LOC165693 (Accession XM\_093373) is another VGAM624 host target gene. LOC165693 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC165693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165693 BINDING SITE, designated SEQ ID:40187, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26170] Another function of VGAM624 is therefore inhibition of LOC165693 (Accession XM\_093373). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165693. LOC220020 (Accession XM\_167821) is another VGAM624 host target gene. LOC220020 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC220020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220020 BINDING SITE, designated SEQ ID:44865, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26171] Another function of VGAM624 is therefore inhibition of LOC220020 (Accession XM\_167821). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220020. LOC220766 (Accession XM\_165471) is another VGAM624 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43651, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26172] Another function of VGAM624 is therefore inhibition of LOC220766 (Accession XM\_165471). Accordingly, utilities

of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC254826 (Accession XM\_173188) is another VGAM624 host target gene. LOC254826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE, designated SEQ ID:46434, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26173] Another function of VGAM624 is therefore inhibition of LOC254826 (Accession XM\_173188). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826. LOC257554 (Accession XM\_175149) is another VGAM624 host target gene. LOC257554 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257554 BINDING SITE, designated SEQ ID:46641, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26174] Another function of VGAM624 is therefore inhibition of LOC257554 (Accession XM\_175149). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257554. LOC92568 (Accession XM\_045852) is another VGAM624 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34573, to the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, also designated SEQ ID:3335.

[26175] Another function of VGAM624 is therefore inhibition of LOC92568 (Accession XM\_045852). Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 625 (VGAM625) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26176] VGAM625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM625 was detected is described hereinabove with reference to Figs. 1–8.

[26177] VGAM625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26178] VGAM625 gene encodes a VGAM625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM625 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM625 precursor RNA is designated SEQ ID:611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:611 is located at position 6632 relative to the genome of Hepati–

tis GB Virus C.

[26179] VGAM625 precursor RNA folds onto itself, forming VGAM625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26180] An enzyme complex designated DICER COMPLEX, `dices` the VGAM625 folded precursor RNA into VGAM625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM625 RNA is designated SEQ ID:3336, and is provided hereinbelow with reference to the sequence listing part.

[26181] VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM625 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26182] VGAM625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM625 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26183] The complementary binding of VGAM625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM625 host target RNA into VGAM625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26184] It is appreciated that VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM625 host target genes. The mRNA of each one of this plurality of VGAM625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM625 RNA, herein designated VGAM RNA, and which when bound by VGAM625 RNA causes inhibition of translation of respective one or more VGAM625 host target proteins.

[26185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM625 gene, herein designated VGAM GENE, on one or more VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26186] It is yet further appreciated that a function of VGAM625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM625 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26187] Nucleotide sequences of the VGAM625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM625 are further described hereinbelow with reference to Table 1.

[26188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM625 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26189] As mentioned hereinabove with reference to Fig. 1, a function of VGAM625 gene, herein designated VGAM is inhibition of expression of VGAM625 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM625 correlate with, and may be deduced

from, the identity of the target genes which VGAM625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26190] Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862) is a VGAM625 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16934, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26191] A function of VGAM625 is therefore inhibition of Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM345.Otoferlin (OTOF, Accession NM\_004802) is another VGAM625 host target gene. OTOF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OTOF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTOF BINDING SITE, designated SEQ ID:11224, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26192] Another function of VGAM625 is therefore inhibition of Otoferlin (OTOF, Accession NM\_004802), a gene which is involved in vesicle membrane fusion and required for inner ear function. Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OTOF. The function of OTOF has been established by previous studies. Using a candidate gene approach, Yasunaga et al. (1999) identified a novel human gene, which they called OTOF, mutation in which causes DFNB9 (OMIM Ref. No. 601071). DFNB9 had been linked to chromosome 2p23.1, between D2S2303 and D2S174. Yasunaga et al. (1999) refined the interval to a 1-cM interval between D2S158 and D2S174.

A contig of YACs, BACs, and PACs was constructed, and 2 genes, HADHB and CENPA, and 4 ESTs were assigned to the interval. The genes were excluded as candidates for DFNB9 by function. The ESTs were submitted to rounds of 5-prime RACE-PCR and the deduced amino acids were compared with clones isolated from 2 subtracted mouse cochlear cDNA libraries. The human OTOF gene encodes a 4,954-bp transcript with a 3,690-bp open reading frame and a 1,038-bp 3-prime untranslated region with a polyadenylation signal at position 4934. The 1,230-amino acid protein has a calculated molecular mass of 140.5 kD. It has 3 C2 domains and a single carboxy-terminal trans-membrane domain. The protein is homologous to the *C. elegans* spermatogenesis factor FER-1 and human dysferlin (OMIM Ref. No. 603009), prompting the authors to name it 'otoferlin.' The homology suggests the otoferlin is involved in vesicle membrane fusion. The OTOF gene extends over 21 kb and contains 28 coding exons and a 5-prime untranslated region exon. Otof expression was identified by RT-PCR in mouse cochlea, vestibule, and brain. By in situ hybridization, Otof labeling was seen in the inner hair cells, and faintly in the outer hair cells and spiral ganglion cells, at embryonic day 19.5, P0, and P2.

Neuroepithelia of the utricle, saccule, and semicircular canals expressed Otof during the same days. Type I cells, but not type II cells or supporting cells, expressed Otof. By Northern blot analysis, Yasunaga et al. (2000) detected a 7-kb otoferlin mRNA in the human brain. They isolated a corresponding cDNA, which was predicted to encode a 1,977-long form of otoferlin with 6 C2 domains. They found that the human OTOF gene contains 48 coding exons and spans approximately 90 kb. Other alternatively spliced transcripts were detected, which predicted several long isoforms (with 6 C2 domains) in humans and mice and short isoforms (3 C2 domains) only in humans. Yasunaga et al. (2000) studied a consanguineous family originating from India in which 3 sibs suffered from severe to profound hearing loss. By segregation analysis with polymorphic markers of the DFNB9 chromosomal region, they concluded that an OTOF mutation was likely to underlie deafness in this family. By sequencing the 48 OTOF coding exons in members of this family, they identified a splice mutation in intron 8 (603681.0002). These studies demonstrated that the long otoferlin isoforms are

By Northern blot analysis, Yasunaga et al. (2000) detected a 7-kb otoferlin mRNA in the human brain. They isolated

a corresponding cDNA, which was predicted to encode a 1,977-long form of otoferlin with 6 C2 domains. They found that the human OTOF gene contains 48 coding exons and spans approximately 90 kb. Other alternatively spliced transcripts were detected, which predicted several long isoforms (with 6 C2 domains) in humans and mice and short isoforms (3 C2 domains) only in humans. Yasunaga et al. (2000) studied a consanguineous family originating from India in which 3 sibs suffered from severe to profound hearing loss. By segregation analysis with polymorphic markers of the DFNB9 chromosomal region, they concluded that an OTOF mutation was likely to underlie deafness in this family. By sequencing the 48 OTOF coding exons in members of this family, they identified a splice mutation in intron 8 (603681.0002). These studies demonstrated that the long otoferlin isoforms are required for inner ear function.

[26193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26194] Yasunaga, S.; Grati, M.; Chardenoux, S.; Smith, T. N.; Friedman, T. B.; Lalwani, A. K.; Wilcox, E. R.; Petit, C. : OTOF encodes multiple long and short isoforms: genetic

evidence that the long ones underlie recessive deafness  
DFNB9. Am. J. Hum. Genet. 67: 591–600, 2000. ; and

[26195] Yasunaga, S.; Grati, M.; Cohen–Salmon, M.; El–Amraoui, A.; Mustapha, M.; Salem, N.; El–Zir, E.; Loiselet, J.; Petit, C. : A mutation in OTOF, encoding otoferlin, a FER–1–like protein, c.

[26196] Further studies establishing the function and utilities of OTOF are found in John Hopkins OMIM database record ID 603681, and in cited publications numbered 8486–8487, 786 and 8488 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regulator of G–protein Signalling 3 (RGS3, Accession NM\_134427) is another VGAM625 host target gene. RGS3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RGS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS3 BINDING SITE, designated SEQ ID:28669, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26197] Another function of VGAM625 is therefore inhibition of Regulator of G–protein Signalling 3 (RGS3, Accession

NM\_134427), a gene which negatively regulates G protein-coupled receptor signalling. Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3. The function of RGS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202) is another VGAM625 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9194, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26198] Another function of VGAM625 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. ABLIM

(Accession NM\_002313) is another VGAM625 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8115 and SEQ ID:13548 respectively, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26199] Another function of VGAM625 is therefore inhibition of ABLIM (Accession NM\_002313). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. DKFZP564L0864 (Accession XM\_051905) is another VGAM625 host target gene. DKFZP564L0864 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564L0864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L0864 BINDING SITE, designated

SEQ ID:35920, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26200] Another function of VGAM625 is therefore inhibition of DKFZP564L0864 (Accession XM\_051905). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564L0864. FLJ12552 (Accession NM\_022832) is another VGAM625 host target gene. FLJ12552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12552 BINDING SITE, designated SEQ ID:23114, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26201] Another function of VGAM625 is therefore inhibition of FLJ12552 (Accession NM\_022832). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12552. FLJ22390 (Accession NM\_022746) is another VGAM625 host target gene. FLJ22390 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ22390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:22958, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26202] Another function of VGAM625 is therefore inhibition of FLJ22390 (Accession NM\_022746). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. KIAA0210 (Accession NM\_014744) is another VGAM625 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16422, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26203] Another function of VGAM625 is therefore inhibition of

KIAA0210 (Accession NM\_014744). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. Nuclear Receptor Subfamily 1, Group I, Member 3 (NR1I3, Accession NM\_005122) is another VGAM625 host target gene. NR1I3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NR1I3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I3 BINDING SITE, designated SEQ ID:11605, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26204] Another function of VGAM625 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 3 (NR1I3, Accession NM\_005122). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I3. Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6B (SEMA6B, Accession NM\_032108) is another VGAM625 host target gene. SEMA6B BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SEMA6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA6B BINDING SITE, designated SEQ ID:25800, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26205] Another function of VGAM625 is therefore inhibition of Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6B (SEMA6B, Accession NM\_032108). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA6B. SV2 (Accession NM\_014849) is another VGAM625 host target gene. SV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2 BINDING SITE, designated SEQ ID:16884, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26206] Another function of VGAM625 is therefore inhibition of

SV2 (Accession NM\_014849). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2.

LOC133814 (Accession XM\_068546) is another VGAM625 host target gene. LOC133814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133814 BINDING SITE, designated SEQ ID:37381, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26207] Another function of VGAM625 is therefore inhibition of LOC133814 (Accession XM\_068546). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133814. LOC146227 (Accession XM\_085374) is another VGAM625 host target gene. LOC146227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:38088, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26208] Another function of VGAM625 is therefore inhibition of LOC146227 (Accession XM\_085374). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227. LOC152674 (Accession XM\_098251) is another VGAM625 host target gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41539, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26209] Another function of VGAM625 is therefore inhibition of LOC152674 (Accession XM\_098251). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC197287 (Accession XM\_027541) is an-

other VGAM625 host target gene. LOC197287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197287 BINDING SITE, designated SEQ ID:30522, to the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, also designated SEQ ID:3336.

[26210] Another function of VGAM625 is therefore inhibition of LOC197287 (Accession XM\_027541). Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197287. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 626 (VGAM626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26211] VGAM626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM626 was detected is described

hereinabove with reference to Figs. 1–8.

[26212] VGAM626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C.

VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26213] VGAM626 gene encodes a VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM626 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM626 precursor RNA is designated SEQ ID:612, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:612 is located at position 1889 relative to the genome of Hepatitis GB Virus C.

[26214] VGAM626 precursor RNA folds onto itself, forming VGAM626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[26215] An enzyme complex designated DICER COMPLEX, `dices` the VGAM626 folded precursor RNA into VGAM626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM626 RNA is designated SEQ ID:3337, and is provided hereinbelow with reference to the sequence listing part.

[26216] VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM626 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26217] VGAM626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM626 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26218] The complementary binding of VGAM626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM626 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM626 host target RNA into VGAM626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26219] It is appreciated that VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM626 host target genes. The mRNA of each one of this plurality of VGAM626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM626 RNA, herein designated VGAM RNA, and which when bound by VGAM626 RNA causes inhibition of translation of respective one or more VGAM626 host target proteins.

[26220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM626 gene, herein designated VGAM GENE, on one or more VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26221] It is yet further appreciated that a function of VGAM626 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM626 correlate with, and may be deduced from, the identity of the host target genes which VGAM626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26222] Nucleotide sequences of the VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM626 are further described hereinbelow with reference to Table 1.

[26223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM626 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26224] As mentioned hereinabove with reference to Fig. 1, a function of VGAM626 gene, herein designated VGAM is inhibition of expression of VGAM626 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM626 correlate with, and may be deduced from, the identity of the target genes which VGAM626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26225] Adrenergic, Beta, Receptor Kinase 1 (ADRBK1, Accession NM\_001619) is a VGAM626 host target gene. ADRBK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRBK1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRBK1 BINDING SITE, designated SEQ ID:7328, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26226] A function of VGAM626 is therefore inhibition of Adrenergic, Beta, Receptor Kinase 1 (ADRBK1, Accession NM\_001619), a gene which regulates desensitization of  $\beta$ -adrenergic receptors and related GPCRs. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRBK1. The function of ADRBK1 has been established by previous studies. Beta-adrenergic receptor kinase (BARK) phosphorylates the  $\beta$ -2-adrenergic receptor (OMIM Ref. No. 109690) and appears to mediate agonist-specific desensitization observed at high agonist concentrations. BARK is a ubiquitous cytosolic enzyme that specifically phosphorylates the activated form of the  $\beta$ -adrenergic and related G protein-coupled receptors. Benovic et al. (1991) used the bovine BARK cDNA to screen a human retina library and isolate the human cDNA. They showed that it encodes a protein of 689 amino acids with an over-

all 98% amino acid and 92.5% nucleotide identity with bovine BARK. By study of rodent/human hybrid cells retaining various human chromosomes and parts of chromosomes, Benovic et al. (1991) demonstrated that the ADRBK1 gene segregates with the long arm of chromosome 11, centromeric to 11q13, i.e., 11cen-q13. Benovic et al. (1991) mapped the homologous gene to mouse chromosome 19. Animal model experiments lend further support to the function of ADRBK1. Rockman et al. (1998) mated transgenic mice with cardiac-restricted overexpression of either a peptide inhibitor of beta-ARK1 or the beta-2-AR into a genetic model of murine heart failure. They found that overexpression of the inhibitor prevented the development of cardiomyopathy in this murine model of heart failure.

[26227] It is appreciated that the abovementioned animal model for ADRBK1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26229] Benovic, J. L.; Stone, W. C.; Huebner, K.; Croce, C.; Caron,

M. G.; Lefkowitz, R. J. : cDNA cloning and chromosomal localization of the human beta-adrenergic receptor kinase. FEBS Lett. 283: 122–126, 1991. ; and

[26231] Further studies establishing the function and utilities of ADRBK1 are found in John Hopkins OMIM database record ID 109635, and in cited publications numbered 1447–1451 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 24-dehydrocholesterol Reductase (DHCR24, Accession NM\_014762) is another VGAM626 host target gene. DHCR24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHCR24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:16525, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26232] Another function of VGAM626 is therefore inhibition of 24-dehydrocholesterol Reductase (DHCR24, Accession NM\_014762), a gene which catalyzes the reduction of sterol intermediates. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR24. The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235. Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860) is another VGAM626 host target gene. FSTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL3 BINDING SITE, designated SEQ ID:12469, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26233] Another function of VGAM626 is therefore inhibition of Follistatin-like 3 (secreted glycoprotein) (FSTL3, Accession NM\_005860), a gene which is a member of the follistatin-module-protein family. Accordingly, utilities of VGAM626

include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL3. The function of FSTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Lymphocyte Antigen 6 Complex, Locus E (LY6E, Accession NM\_002346) is another VGAM626 host target gene. LY6E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY6E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY6E BINDING SITE, designated SEQ ID:8147, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26234] Another function of VGAM626 is therefore inhibition of Lymphocyte Antigen 6 Complex, Locus E (LY6E, Accession NM\_002346). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY6E. NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM\_021075) is another VGAM626 host target gene. NDUFV3 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by NDUFV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFV3 BINDING SITE, designated SEQ ID:22044, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26235] Another function of VGAM626 is therefore inhibition of NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM\_021075), a gene which transports electrons from NADH to ubiquinone. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFV3. The function of NDUFV3 has been established by previous studies. NADH:ubiquinone oxidoreductase (complex I; EC 1.6.5.3) is an inner mitochondrial membrane-bound multisubunit enzyme complex. Complex I consists of at least 41 subunits of which 7 are encoded by the mitochondrial genome. See MTND1 (OMIM Ref. No. 516000) through MTND6 (OMIM Ref. No. 516006). As one of the complexes of the mitochondrial respiratory chain, complex I functions in the catalysis of

the rotenone-sensitive oxidation of NADH and the reduction of ubiquinone. By means of chaotropic agents, complex I can be resolved into 2 hydrophilic fractions, the flavoprotein fraction and the iron-protein fraction, and a hydrophobic fraction. The flavoprotein fraction comprises the 51-, 24-, and 10-kD subunits, all encoded by the nuclear genes NDUFV1 (OMIM Ref. No. 161015), NDUFV2 (OMIM Ref. No. 600532), and NDUFV3, respectively. This fraction plays a catalytic role in the oxidation of NADH as it is associated with flavoprotein and NAD binding. The 51-kD and 24-kD subunits are involved in electron transfer. The function of the 10-kD protein is unknown. The human gene for the 10-kD flavoprotein subunit was completely cloned and sequenced by de Coo et al. (1997). The NDUFV3 gene was found to contain 3 exons, spanning 20 kb. The open reading frame contains a 34-codon import sequence and a 74-codon mature protein sequence. Its homology to bovine and rat protein sequence was found but not to any other known protein. Northern blot analysis showed that the NDUFV3 gene is ubiquitously expressed. By fluorescence in situ hybridization, de Coo et al. (1997) assigned the NDUFV3 gene to 21q22.3, where it may play a dosage-dependent role in the phenotype of Down syn-

drome (OMIM Ref. No. 190685). Berry et al. (2000) found that NDUFV3 is located approximately 120 kb telomeric to PDE9A (OMIM Ref. No. 602973).

[26236] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26237] Berry, A.; Scott, H. S.; Kudoh, J.; Talior, I.; Korostishevsky, M.; Wattenhofer, M.; Guipponi, M.; Barras, C.; Rossier, C.; Shibuya, K.; Wang, J.; Kawasaki, K.; Asakawa, S.; Minoshima, S.; Shimizu, N.; Antonarakis, S.; Bonne-Tamir, B. : Refined localization of autosomal recessive nonsyndromic deafness DFNB10 locus using 34 novel microsatellite markers, genomic structure, and exclusion of six known genes in the region. *Genomics* 68: 22–29, 2000. ; and

[26238] de Coo, R. F. M.; Buddiger, P.; Smeets, H. J. M.; van Oost, B. A. : Molecular cloning and characterization of the human mitochondrial NADH:oxidoreductase 10-kDa gene (NDUFV3). *Genomics*.

[26239] Further studies establishing the function and utilities of NDUFV3 are found in John Hopkins OMIM database record ID 602184, and in cited publications numbered 786 and 8532 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. Upstream Binding Transcription Factor, RNA Polymerase I (UBTF, Accession NM\_014233) is another VGAM626 host target gene. UBTF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBTF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBTF BINDING SITE, designated SEQ ID:15497, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26240] Another function of VGAM626 is therefore inhibition of Upstream Binding Transcription Factor, RNA Polymerase I (UBTF, Accession NM\_014233), a gene which recognizes the ribosomal rna gene promoter and activates transcription. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBTF. The function of UBTF has been established by previous studies. Upstream binding factor (UBF) is a transcription factor required for expression of the 18S, 5.8S, and 28S ribosomal RNAs, along with SL1 (a complex of TBP (OMIM Ref. No. 600075) and multiple TBP-associated factors or 'TAFs'). Two UBF polypeptides,

of 94 and 97 kD, exist in the human (Bell et al., 1988).

UBF is a nucleolar phosphoprotein with both DNA binding and transactivation domains. Sequence-specific DNA binding to the core and upstream control elements of the human rRNA promoter is mediated through several HMG boxes (Jantzen et al., 1990). Jantzen et al. (1990) cloned human UBF by screening a HeLa cell cDNA library with DNA probes based on tryptic peptides of the protein. They found an open reading frame encoding the 764-amino acid UBF. The authors also characterized DNA binding characteristics of UBF. Chan et al. (1991) cloned the human cDNA by screening an expression library with a specific autoantibody that recognizes nucleolar organizing regions. Jones et al. (1995) mapped the gene, symbolized UBTF, to the BRCA1 region of 17q21 by analyzing genomic clones from that region. They found the gene order to be cen--PPY(OMIM Ref. No.

167780)--UBTF--EPB3(OMIM Ref. No.

109270)--GP2B(OMIM Ref. No. 273800)--tel.

[26241] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26242] Jantzen, H.-M.; Admon, A.; Bell, S. P.; Tjian, R. : Nucleolar

transcription factor hUBF contains a DNA-binding motif with homology to HMG proteins. Nature 344: 830–836, 1990. ; and

[26243] Chan, E. K. L.; Imai, H.; Hamel, J. C.; Tan, E. M. : Human autoantibody to RNA polymerase I transcription factor hUBF: molecular identity of nucleolus organizer region autoantigen NOR-9.

[26244] Further studies establishing the function and utilities of UBTF are found in John Hopkins OMIM database record ID 600673, and in cited publications numbered 1310–1316 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD109 (Accession NM\_133493) is another VGAM626 host target gene. CD109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:28571, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26245] Another function of VGAM626 is therefore inhibition of

CD109 (Accession NM\_133493). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109. DKFZP434N161 (Accession XM\_085920) is another VGAM626 host target gene. DKFZP434N161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N161 BINDING SITE, designated SEQ ID:38397, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26246] Another function of VGAM626 is therefore inhibition of DKFZP434N161 (Accession XM\_085920). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N161. FLJ12750 (Accession NM\_024667) is another VGAM626 host target gene. FLJ12750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ12750 BINDING SITE, designated SEQ ID:23971, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26247] Another function of VGAM626 is therefore inhibition of FLJ12750 (Accession NM\_024667). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12750. KIAA0346 (Accession XM\_043272) is another VGAM626 host target gene. KIAA0346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0346 BINDING SITE, designated SEQ ID:33920, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26248] Another function of VGAM626 is therefore inhibition of KIAA0346 (Accession XM\_043272). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0346. KIAA1023 (Accession NM\_017604) is another

VGAM626 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19089, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26249] Another function of VGAM626 is therefore inhibition of KIAA1023 (Accession NM\_017604). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1163 (Accession XM\_086231) is another VGAM626 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:38556, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26250] Another function of VGAM626 is therefore inhibition of KIAA1163 (Accession XM\_086231). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1465 (Accession XM\_027396) is another VGAM626 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30503, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26251] Another function of VGAM626 is therefore inhibition of KIAA1465 (Accession XM\_027396). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. SCYA14 (Accession NM\_032962) is another VGAM626 host target gene. SCYA14 BINDING SITE1 and SCYA14 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCYA14, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA14 BINDING SITE1 and SCYA14 BINDING SITE2, designated SEQ ID:26773 and SEQ ID:10373 respectively, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26252] Another function of VGAM626 is therefore inhibition of SCYA14 (Accession NM\_032962). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA14. LOC148697 (Accession XM\_086276) is another VGAM626 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148697 BINDING SITE, designated SEQ ID:38573, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26253] Another function of VGAM626 is therefore inhibition of LOC148697 (Accession XM\_086276). Accordingly, utilities

of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC155179 (Accession XM\_088169) is another VGAM626 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39556, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26254] Another function of VGAM626 is therefore inhibition of LOC155179 (Accession XM\_088169). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC219700 (Accession XM\_167570) is another VGAM626 host target gene. LOC219700 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC219700 BINDING SITE, designated SEQ ID:44702, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26255] Another function of VGAM626 is therefore inhibition of LOC219700 (Accession XM\_167570). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219700. LOC220753 (Accession XM\_167549) is another VGAM626 host target gene. LOC220753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220753 BINDING SITE, designated SEQ ID:44662, to the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, also designated SEQ ID:3337.

[26256] Another function of VGAM626 is therefore inhibition of LOC220753 (Accession XM\_167549). Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220753. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 627 (VGAM627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26257] VGAM627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM627 was detected is described hereinabove with reference to Figs. 1–8.

[26258] VGAM627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26259] VGAM627 gene encodes a VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM627 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM627 precursor RNA is designated SEQ ID:613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:613 is located at position 1443 relative to the genome of Hepati-

tis GB Virus C.

[26260] VGAM627 precursor RNA folds onto itself, forming VGAM627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM627 folded precursor RNA into VGAM627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM627 RNA is designated SEQ ID:3338, and is provided hereinbelow with reference to the sequence listing part.

[26262] VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM627 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26263] VGAM627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM627 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[26264] The complementary binding of VGAM627 RNA, herein designated VGAM RNA, to host target binding sites on VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM627 host target RNA into VGAM627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26265] It is appreciated that VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM627 host target genes. The mRNA of each one of this plurality of VGAM627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM627 RNA, herein designated VGAM RNA, and which when bound by VGAM627 RNA causes inhibition of translation of respective one or more VGAM627 host target proteins.

[26266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM627 gene, herein designated VGAM GENE, on one or more VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26267] It is yet further appreciated that a function of VGAM627 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM627 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM627 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26268] Nucleotide sequences of the VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM627 are further described hereinbelow with reference to Table 1.

[26269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM627 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM627 gene, herein designated VGAM is inhibition of expression of VGAM627 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM627 correlate with, and may be deduced

from, the identity of the target genes which VGAM627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26271] FLJ12294 (Accession NM\_025100) is a VGAM627 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24744, to the nucleotide sequence of VGAM627 RNA, herein designated VGAM RNA, also designated SEQ ID:3338.

[26272] A function of VGAM627 is therefore inhibition of FLJ12294 (Accession NM\_025100). Accordingly, utilities of VGAM627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. LOC255718 (Accession XM\_174148) is another VGAM627 host target gene. LOC255718 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC255718 BINDING SITE, designated SEQ ID:46581, to the nucleotide sequence of VGAM627 RNA, herein designated VGAM RNA, also designated SEQ ID:3338.

[26273] Another function of VGAM627 is therefore inhibition of LOC255718 (Accession XM\_174148). Accordingly, utilities of VGAM627 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255718. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 628 (VGAM628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26274] VGAM628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM628 was detected is described hereinabove with reference to Figs. 1–8.

[26275] VGAM628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[26276] VGAM628 gene encodes a VGAM628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM628 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM628 precursor RNA is designated SEQ ID:614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:614 is located at position 3072 relative to the genome of Hepatitis GB Virus C.

[26277] VGAM628 precursor RNA folds onto itself, forming VGAM628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26278] An enzyme complex designated DICER COMPLEX, `dices` the VGAM628 folded precursor RNA into VGAM628 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM628 RNA is designated SEQ ID:3339, and is provided hereinbelow with reference to the sequence listing part.

[26279] VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM628 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26280] VGAM628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM628 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26281] The complementary binding of VGAM628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM628 host target RNA into VGAM628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26282] It is appreciated that VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM628 host target genes. The mRNA of each one of this plurality of VGAM628 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM628 RNA, herein designated VGAM RNA, and which when bound by VGAM628 RNA causes inhibition of translation of respective one or more VGAM628 host target proteins.

[26283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM628 gene, herein designated VGAM GENE, on one or more VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26284] It is yet further appreciated that a function of VGAM628 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM628 correlate with, and may be deduced from, the identity of the host target genes which VGAM628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26285] Nucleotide sequences of the VGAM628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM628 are further described hereinbelow with reference to Table 1.

[26286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM628 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26287] As mentioned hereinabove with reference to Fig. 1, a function of VGAM628 gene, herein designated VGAM is inhibition of expression of VGAM628 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM628 correlate with, and may be deduced from, the identity of the target genes which VGAM628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26288] Hermansky-Pudlak Syndrome 3 (HPS3, Accession NM\_032383) is a VGAM628 host target gene. HPS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS3 BINDING SITE, designated SEQ ID:26176, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26289] A function of VGAM628 is therefore inhibition of Herman-sky-Pudlak Syndrome 3 (HPS3, Accession NM\_032383). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS3. MAP-kinase Activating Death Domain (MADD, Accession NM\_130470) is another VGAM628 host target gene. MADD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MADD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADD BINDING SITE, designated SEQ ID:28232, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26290] Another function of VGAM628 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM\_130470), a gene which may regulate two different pathways for neural activities. interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of

MADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Pleckstrin Homology, Sec7 and Coiled/coil Domains 3 (PSCD3, Accession NM\_004227) is another VGAM628 host target gene. PSCD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD3 BINDING SITE, designated SEQ ID:10422, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26291] Another function of VGAM628 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 3 (PSCD3, Accession NM\_004227), a gene which regulates vesicle trafficking in eukaryotic cells. Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD3. The function of PSCD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM191. Transcription Factor 21 (TCF21, Accession NM\_003206) is another VGAM628 host target gene.

TCF21 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TCF21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF21 BINDING SITE, designated SEQ ID:9204, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26292] Another function of VGAM628 is therefore inhibition of Transcription Factor 21 (TCF21, Accession NM\_003206), a gene which may play a role in the specification or differentiation of one or more subsets of epicardial cell types. Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF21. The function of TCF21 has been established by previous studies. By searching EST databases for class B bHLH proteins expressed in developing kidney, Quaggin et al. (1998) identified human and mouse cDNAs encoding TCF21. They called the protein POD1 because it was highly expressed in podocytes (visceral glomerular epithelial cells). The predicted

179-amino acid human TCF21 protein contains a 57-amino acid bHLH domain, a putative nuclear localization signal, and an acidic transcriptional activation domain. Human TCF21 shares 60% and 95% protein sequence identity with TCF15 (OMIM Ref. No. 601010) and mouse Tcf21, respectively. Northern blot analysis revealed that TCF21 is expressed as a 1.3-kb mRNA in human lung, kidney, heart, and placenta, and at lower levels in pancreas. Animal model experiments lend further support to the function of TCF21. Lu et al. (2000) demonstrated that mice homozygous for a capsulin-null mutation fail to form a spleen. Homozygous mutant embryos expressed Hox11 (OMIM Ref. No. 186770) and Bapx1 (OMIM Ref. No. 602183), which had previously been shown to be essential regulators of spleen organogenesis. However, in the capsulin-null homozygous embryos, the primordium of the spleen failed to develop beyond an initial group of precursor cells and underwent rapid apoptosis. The phenotype of capsulin mutant mice demonstrated that capsulin acts within a subpopulation of splanchnic mesodermal cells to control an essential early step in spleen organogenesis that is likely to represent a point of regulatory convergence of the capsulin, Hox11, and Bapx1 genes.

[26293] It is appreciated that the abovementioned animal model for TCF21 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26294] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26295] Lu, J.; Chang, P.; Richardson, J. A.; Gan, L.; Weiler, H.; Olson, E. N. : The basic helix-loop-helix transcription factor capsulin controls spleen organogenesis. Proc. Nat. Acad. Sci. 97: 9525-9530, 2000. ; and

[26296] Quaggin, S. E.; Vanden Heuvel, G. B.; Igarashi, P. : Pod-1, a mesoderm-specific basic-helix-loop-helix protein expressed in mesenchymal and glomerular epithelial cells in the developi.

[26297] Further studies establishing the function and utilities of TCF21 are found in John Hopkins OMIM database record ID 603306, and in cited publications numbered 2442-2446 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DJ37E16.5 (Accession NM\_020315) is another VGAM628 host target gene. DJ37E16.5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by DJ37E16.5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ37E16.5 BINDING SITE, designated SEQ ID:21578, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26298] Another function of VGAM628 is therefore inhibition of DJ37E16.5 (Accession NM\_020315). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ37E16.5. DKFZP564O123 (Accession XM\_002810) is another VGAM628 host target gene. DKFZP564O123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O123 BINDING SITE, designated SEQ ID:29903, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26299] Another function of VGAM628 is therefore inhibition of

DKFZP564O123 (Accession XM\_002810). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O123. FLJ10761 (Accession NM\_018208) is another VGAM628 host target gene. FLJ10761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10761 BINDING SITE, designated SEQ ID:20105, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26300] Another function of VGAM628 is therefore inhibition of FLJ10761 (Accession NM\_018208). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10761. FLJ23189 (Accession NM\_025057) is another VGAM628 host target gene. FLJ23189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ23189 BINDING SITE, designated SEQ ID:24654, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26301] Another function of VGAM628 is therefore inhibition of FLJ23189 (Accession NM\_025057). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23189. NYD-SP11 (Accession NM\_031951) is another VGAM628 host target gene. NYD-SP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NYD-SP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP11 BINDING SITE, designated SEQ ID:25692, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26302] Another function of VGAM628 is therefore inhibition of NYD-SP11 (Accession NM\_031951). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP11. SSH2 (Accession XM\_030846) is another VGAM628

host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31184, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26303] Another function of VGAM628 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC124976 (Accession XM\_058879) is another VGAM628 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE, designated SEQ ID:36784, to the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, also designated SEQ ID:3339.

[26304] Another function of VGAM628 is therefore inhibition of LOC124976 (Accession XM\_058879). Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 629 (VGAM629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26305] VGAM629 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM629 was detected is described hereinabove with reference to Figs. 1–8.

[26306] VGAM629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26307] VGAM629 gene encodes a VGAM629 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM629

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM629 precursor RNA is designated SEQ ID:615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:615 is located at position 7116 relative to the genome of Hepatitis GB Virus C.

[26308] VGAM629 precursor RNA folds onto itself, forming VGAM629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26309] An enzyme complex designated DICER COMPLEX, `dices` the VGAM629 folded precursor RNA into VGAM629 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM629 RNA is designated SEQ ID:3340, and is provided hereinbelow with reference to the sequence listing part.

[26310] VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM629 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[26311] VGAM629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM629 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26312] The complementary binding of VGAM629 RNA, herein designated VGAM RNA, to host target binding sites on VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM629 host target RNA into VGAM629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26313] It is appreciated that VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM629 host target genes. The mRNA of each one of this plurality of VGAM629 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM629 RNA, herein designated VGAM RNA, and which when bound by VGAM629 RNA causes inhibition of translation of respective one or more VGAM629 host target proteins.

[26314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM629 gene, herein designated VGAM GENE, on one or more VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26315] It is yet further appreciated that a function of VGAM629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM629 correlate with, and may be deduced from, the identity of the host target genes which VGAM629 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26316] Nucleotide sequences of the VGAM629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM629 are further described hereinbelow with reference to Table 1.

[26317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM629 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM629 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[26318] As mentioned hereinabove with reference to Fig. 1, a function of VGAM629 gene, herein designated VGAM is inhibition of expression of VGAM629 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM629 correlate with, and may be deduced from, the identity of the target genes which VGAM629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26319] ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM\_001681) is a VGAM629 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7398, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26320] A function of VGAM629 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM\_001681). Accordingly, utilities of

VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. KIAA1643 (Accession XM\_035371) is another VGAM629 host target gene. KIAA1643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:32237, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26321] Another function of VGAM629 is therefore inhibition of KIAA1643 (Accession XM\_035371). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. MGC10999 (Accession NM\_032307) is another VGAM629 host target gene. MGC10999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC10999 BINDING SITE, designated SEQ ID:26089, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26322] Another function of VGAM629 is therefore inhibition of MGC10999 (Accession NM\_032307). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999. NAF1 (Accession NM\_006058) is another VGAM629 host target gene. NAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAF1 BINDING SITE, designated SEQ ID:12702, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26323] Another function of VGAM629 is therefore inhibition of NAF1 (Accession NM\_006058). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAF1. Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM\_005446) is another VGAM629 host target gene.

TJP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP2 BINDING SITE, designated SEQ ID:29981, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26324] Another function of VGAM629 is therefore inhibition of Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM\_005446). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP2. TSPEAR (Accession NM\_144991) is another VGAM629 host target gene. TSPEAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPEAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPEAR BINDING SITE, designated SEQ ID:29595, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26325] Another function of VGAM629 is therefore inhibition of TSPEAR (Accession NM\_144991). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPEAR. LOC113730 (Accession XM\_054631) is another VGAM629 host target gene. LOC113730 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC113730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113730 BINDING SITE, designated SEQ ID:36182, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26326] Another function of VGAM629 is therefore inhibition of LOC113730 (Accession XM\_054631). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113730. LOC152687 (Accession XM\_087503) is another VGAM629 host target gene. LOC152687 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152687, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152687 BINDING SITE, designated SEQ ID:39302, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26327] Another function of VGAM629 is therefore inhibition of LOC152687 (Accession XM\_087503). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152687. LOC164582 (Accession XM\_092881) is another VGAM629 host target gene. LOC164582 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164582 BINDING SITE, designated SEQ ID:40156, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26328] Another function of VGAM629 is therefore inhibition of LOC164582 (Accession XM\_092881). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC164582. LOC220370 (Accession XM\_166943) is another VGAM629 host target gene. LOC220370 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220370 BINDING SITE, designated SEQ ID:44597, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26329] Another function of VGAM629 is therefore inhibition of LOC220370 (Accession XM\_166943). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220370. LOC221763 (Accession XM\_168107) is another VGAM629 host target gene. LOC221763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221763 BINDING SITE, designated SEQ ID:45034, to the nucleotide sequence of VGAM629 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3340.

[26330] Another function of VGAM629 is therefore inhibition of LOC221763 (Accession XM\_168107). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221763. LOC89932 (Accession XM\_027341) is another VGAM629 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30486, to the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, also designated SEQ ID:3340.

[26331] Another function of VGAM629 is therefore inhibition of LOC89932 (Accession XM\_027341). Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 630 (VGAM630) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26332] VGAM630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM630 was detected is described hereinabove with reference to Figs. 1–8.

[26333] VGAM630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus C. VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26334] VGAM630 gene encodes a VGAM630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM630 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM630 precursor RNA is designated SEQ ID:616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:616 is located at position 4257 relative to the genome of Hepatitis GB Virus C.

[26335] VGAM630 precursor RNA folds onto itself, forming

VGAM630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM630 folded precursor RNA into VGAM630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM630 RNA is designated SEQ ID:3341, and is provided hereinbelow with reference to the sequence listing part.

[26337] VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM630 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26338] VGAM630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM630 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26339] The complementary binding of VGAM630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM630 host target RNA into VGAM630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26340] It is appreciated that VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM630 host target genes. The mRNA of each one of this plurality of VGAM630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM630 RNA, herein designated VGAM RNA, and which when bound by VGAM630 RNA causes inhibition of translation of respective one or more VGAM630 host target proteins.

[26341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM630 gene, herein designated VGAM GENE, on one or more VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26342] It is yet further appreciated that a function of VGAM630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus C. Specific functions, and accordingly utilities, of VGAM630 correlate with, and may be deduced from, the identity of the host target genes which VGAM630 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[26343] Nucleotide sequences of the VGAM630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM630 are further described hereinbelow with reference to Table 1.

[26344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM630 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM630 gene, herein designated VGAM is inhibition of expression of VGAM630 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM630 correlate with, and may be deduced from, the identity of the target genes which VGAM630 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[26346] Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899) is a VGAM630 host target gene. GORASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GORASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated SEQ ID:25644, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26347] A function of VGAM630 is therefore inhibition of Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899), a gene which has some function with the Golgi apparatus. Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1. The function of GORASP1 has been established by previous studies. Barr et al. (1998) determined that GOLPH5 interacts with GM130 (OMIM Ref. No. 602580), a Golgi matrix protein, in detergent extracts of rat liver Golgi membranes. They further determined that this complex can bind to the vesicle

docking protein p115 (OMIM Ref. No. 603344). Using in vitro translation and site-directed mutagenesis in conjunction with immunoprecipitation, Barr et al. (1998) localized the critical interacting domains to the C terminus of GM130 and the PDZ-like domain of GOLPH5. Interaction was also found to be critical for the correct targeting of both proteins to the Golgi apparatus. Sutterlin et al. (2002) found that addition of an antibody to the Golgi-associated protein GRASP65 inhibited Golgi fragmentation by mitotic cytosol in permeabilized cells. Microinjecting this antibody or a C-terminal fragment of GRASP65 containing the antibody-binding site into normal rat kidney cells prevented entry into mitosis. Under these conditions the cells had completed S phase but were not in the prophase stage of mitosis. Fragmentation of the Golgi apparatus by nocodazole or brefeldin A treatment prior to or after microinjection of the anti-GRASP65 antibody alleviated the block in mitotic entry. These data suggested that pericentriolar Golgi organization is a sensor for controlling entry into mitosis in mammalian cells.

[26348] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [26349] Barr, F. A.; Nakamura, N.; Warren, G. : Mapping the interaction between GRASP65 and GM130, components of a protein complex involved in the stacking of Golgi cisternae. EMBO J. 17: 3258–3268, 1998. ; and
- [26350] Sutterlin, C.; Hsu, P.; Mallabiabarrena, A.; Malhotra, V. : Fragmentation and dispersal of the pericentriolar Golgi complex is required for entry into mitosis in mammalian cells. Cell 1.
- [26351] Further studies establishing the function and utilities of GORASP1 are found in John Hopkins OMIM database record ID 606867, and in cited publications numbered 9039–5584 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679) is another VGAM630 host target gene. TAF1C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF1C BINDING SITE, designated SEQ ID:12234, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also desig–

nated SEQ ID:3341.

[26352] Another function of VGAM630 is therefore inhibition of TATA Box Binding Protein (TBP)–associated Factor, RNA Polymerase I, C, 110kDa (TAF1C, Accession NM\_005679), a gene which belongs to component of the RNA polymerase I and II SL1 transcription factor. Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF1C. The function of TAF1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.DRIL2 (Accession NM\_006465) is another VGAM630 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13181, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26353] Another function of VGAM630 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of

VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2.

LOC120114 (Accession XM\_061871) is another VGAM630 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37212, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26354] Another function of VGAM630 is therefore inhibition of LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC204823 (Accession XM\_115621) is another VGAM630 host target gene. LOC204823 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC204823 BINDING SITE, designated SEQ ID:43101, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26355] Another function of VGAM630 is therefore inhibition of LOC204823 (Accession XM\_115621). Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204823. LOC220672 (Accession XM\_017177) is another VGAM630 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:30307, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26356] Another function of VGAM630 is therefore inhibition of LOC220672 (Accession XM\_017177). Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. LOC90841 (Accession XM\_034427) is another VGAM630 host target gene. LOC90841 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90841 BINDING SITE, designated SEQ ID:32109, to the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, also designated SEQ ID:3341.

[26357] Another function of VGAM630 is therefore inhibition of LOC90841 (Accession XM\_034427). Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90841. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 631 (VGAM631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26358] VGAM631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM631 was detected is described hereinabove with reference to Figs. 1-8.

[26359] VGAM631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Astrovirus.

VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26360] VGAM631 gene encodes a VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM631 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM631 precursor RNA is designated SEQ ID:617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:617 is located at position 1595 relative to the genome of Ovine Astrovirus.

[26361] VGAM631 precursor RNA folds onto itself, forming VGAM631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[26362] An enzyme complex designated DICER COMPLEX, `dices` the VGAM631 folded precursor RNA into VGAM631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM631 RNA is designated SEQ ID:3342, and is provided hereinbelow with reference to the sequence listing part.

[26363] VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM631 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26364] VGAM631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM631 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM631 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26365] The complementary binding of VGAM631 RNA, herein designated VGAM RNA, to host target binding sites on VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM631 host target RNA into VGAM631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26366] It is appreciated that VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM631 host target genes. The mRNA of each one of this plurality of VGAM631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM631 RNA, herein designated VGAM RNA, and which when bound by VGAM631 RNA causes inhibition of translation of respective one or more VGAM631 host target proteins.

[26367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM631 gene, herein designated VGAM GENE, on one or more VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26368] It is yet further appreciated that a function of VGAM631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of viral infection by Ovine Astrovirus. Specific functions, and accordingly utilities, of VGAM631 correlate with, and may be deduced from, the identity of the host target genes which VGAM631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26369] Nucleotide sequences of the VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM631 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM631 are further described hereinbelow with reference to Table 1.

[26370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM631 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26371] As mentioned hereinabove with reference to Fig. 1, a function of VGAM631 gene, herein designated VGAM is inhibition of expression of VGAM631 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM631 correlate with, and may be deduced from, the identity of the target genes which VGAM631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26372] Deoxyribonuclease I (DNASE1, Accession NM\_005223) is a VGAM631 host target gene. DNASE1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DNASE1 BINDING SITE, designated SEQ ID:11714, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26373] A function of VGAM631 is therefore inhibition of Deoxyribonuclease I (DNASE1, Accession NM\_005223), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1. The function of DNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492. Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051) is another VGAM631 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22582, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26374] Another function of VGAM631 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874) is another VGAM631 host target gene. IFNAR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IFNAR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:6552, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26375] Another function of VGAM631 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874), a gene which is a receptor for in-

terferons alpha and beta. Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2. The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM487. Collagen, Type XII, Alpha 1 (COL12A1, Accession NM\_080645) is another VGAM631 host target gene. COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL12A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2, designated SEQ ID:27936 and SEQ ID:10589 respectively, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26376] Another function of VGAM631 is therefore inhibition of Collagen, Type XII, Alpha 1 (COL12A1, Accession NM\_080645). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL12A1. KIAA1091

(Accession XM\_045750) is another VGAM631 host target gene. KIAA1091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1091 BINDING SITE, designated SEQ ID:34543, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26377] Another function of VGAM631 is therefore inhibition of KIAA1091 (Accession XM\_045750). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1091. NRF (Accession NM\_017544) is another VGAM631 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18986, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3342.

[26378] Another function of VGAM631 is therefore inhibition of NRF (Accession NM\_017544). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF.

LOC148089 (Accession XM\_086040) is another VGAM631 host target gene. LOC148089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:38451, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26379] Another function of VGAM631 is therefore inhibition of LOC148089 (Accession XM\_086040). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148089. LOC148490 (Accession XM\_086210) is another VGAM631 host target gene. LOC148490 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148490, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:38546, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26380] Another function of VGAM631 is therefore inhibition of LOC148490 (Accession XM\_086210). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490. LOC148764 (Accession XM\_086307) is another VGAM631 host target gene. LOC148764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148764 BINDING SITE, designated SEQ ID:38589, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26381] Another function of VGAM631 is therefore inhibition of LOC148764 (Accession XM\_086307). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148764. LOC155179 (Accession XM\_088169) is another VGAM631 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39552, to the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26382] Another function of VGAM631 is therefore inhibition of LOC155179 (Accession XM\_088169). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC91355 (Accession XM\_037825) is another VGAM631 host target gene. LOC91355 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91355 BINDING SITE, designated SEQ ID:32702, to the

nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, also designated SEQ ID:3342.

[26383] Another function of VGAM631 is therefore inhibition of LOC91355 (Accession XM\_037825). Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91355. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 632 (VGAM632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26384] VGAM632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM632 was detected is described hereinabove with reference to Figs. 1–8.

[26385] VGAM632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Astrovirus. VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26386] VGAM632 gene encodes a VGAM632 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM632 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM632 precursor RNA is designated SEQ ID:618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:618 is located at position 1405 relative to the genome of Ovine Astrovirus.

[26387] VGAM632 precursor RNA folds onto itself, forming VGAM632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26388] An enzyme complex designated DICER COMPLEX, `dices` the VGAM632 folded precursor RNA into VGAM632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM632 RNA is designated SEQ ID:3343, and is provided hereinbelow with reference to the sequence listing part.

[26389] VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM632 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26390] VGAM632 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM632 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26391] The complementary binding of VGAM632 RNA, herein designated VGAM RNA, to host target binding sites on VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM632 host target RNA into VGAM632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26392] It is appreciated that VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM632 host target genes. The mRNA of each one of this plurality of VGAM632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM632 RNA, herein designated VGAM RNA, and which when bound by VGAM632 RNA causes inhibition of translation of respective one or more VGAM632 host target proteins.

[26393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM632 gene, herein designated VGAM GENE, on one or more VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[26394] It is yet further appreciated that a function of VGAM632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of viral infection by Ovine Astrovirus. Specific functions, and accordingly utilities, of VGAM632 correlate with, and may be deduced from, the identity of the host target genes which VGAM632 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[26395] Nucleotide sequences of the VGAM632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM632 are further described hereinbelow with reference to Table 1.

[26396] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM632 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26397] As mentioned hereinabove with reference to Fig. 1, a function of VGAM632 gene, herein designated VGAM is inhibition of expression of VGAM632 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM632 correlate with, and may be deduced from, the identity of the target genes which VGAM632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26398] Calcium Channel, Voltage-dependent, Gamma Subunit 6 (CACNG6, Accession NM\_031897) is a VGAM632 host target gene. CACNG6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CACNG6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG6 BINDING SITE, designated SEQ ID:25642, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26399] A function of VGAM632 is therefore inhibition of Calcium

Channel, Voltage-dependent, Gamma Subunit 6 (CACNG6, Accession NM\_031897), a gene which plays a role in excitation-contraction coupling. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG6. The function of CACNG6 has been established by previous studies. Voltage-dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore-forming alpha-1 (e.g., CACNA1D; 114206) subunit and the modulatory beta (e.g., CACNB1; 114207), alpha-2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By RT-PCR and genomic sequence analysis, Burgess et al. (2001) determined that the CACNG6 gene, like CACNG7 and CACNG8, contains 4 exons. A potential splice variant lacking exon 3 would eliminate 2 transmembrane domains.

[26400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26403] Further studies establishing the function and utilities of CACNG6 are found in John Hopkins OMIM database record ID 606898, and in cited publications numbered 4526–4527 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chimerin (chimaerin) 1 (CHN1, Accession NM\_001822) is another VGAM632 host target gene. CHN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHN1 BINDING SITE, designated SEQ ID:7562, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26404] Another function of VGAM632 is therefore inhibition of Chimerin (chimaerin) 1 (CHN1, Accession NM\_001822), a gene which may play an important role in neuronal signal–

transduction mechanisms. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHN1. The function of CHN1 has been established by previous studies. Hall et al. (1990) isolated a novel human brain cDNA sequence encoding n-chimerin, a 34,000 M(r) protein. They found that the N-terminal half shared almost 50% identity with sequences in the regulatory domain of protein kinase C (OMIM Ref. No. 176960); the C-terminal half had 42% identity with the C-terminal region of BCR, the product of the breakpoint cluster region gene involved in the Philadelphia chromosome translocation (OMIM Ref. No. 151410). Also known as alpha-1-chimerin, n-chimerin is a brain GTPase-activating protein (GAP) for the RAS-related p21 (RAC). Hall et al. (1993) found another form of chimerin, termed alpha-2-chimerin, and showed that it is the product of an alternately spliced transcript of the human n-chimerin gene. The mRNAs corresponding to the 2 forms of chimerin were expressed differently. The single human n-chimerin gene was mapped to 2q31-q32.1 by Southern analysis of a hybrid cell DNA panel and by fluorescence in situ hybridization.

[26405] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [26406] Hall, C.; Monfries, C.; Smith, P.; Lim, H. H.; Kozma, R.; Ahmed, S.; Vanniasingham, V.; Leung, T.; Lim, L. : Novel human brain cDNA encoding a 34,000 M(r) protein n-chimaerin, related to both the regulatory domain of protein kinase C and BCR, the product of the breakpoint cluster region gene. J. Molec. Biol. 211: 11-16, 1990. ; and
- [26407] Hall, C.; Sin, W. C.; Teo, M.; Michael, G. J.; Smith, P.; Dong, J. M.; Lim, H. H.; Manser, E.; Spurr, N. K.; Jones, T. A.; Lim, L. : Alpha-2-chimerin, an SH2-containing GTPase-activator.
- [26408] Further studies establishing the function and utilities of CHN1 are found in John Hopkins OMIM database record ID 118423, and in cited publications numbered 3719-3720 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Early Growth Response 3 (EGR3, Accession XM\_005040) is another VGAM632 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29955, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26409] Another function of VGAM632 is therefore inhibition of Early Growth Response 3 (EGR3, Accession XM\_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. Forkhead Box E3 (FOX E3, Accession NM\_012186) is another VGAM632 host target gene. FOX E3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOX E3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOX E3 BINDING SITE, designated SEQ ID:14472, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26410] Another function of VGAM632 is therefore inhibition of Forkhead Box E3 (FOXE3, Accession NM\_012186), a gene which regulates embryonic development. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE3. The function of FOXE3 has been established by previous studies. Dysgenesis of the anterior segment of the eye is frequently associated with cataracts and glaucoma, resulting in visual disability in childhood. Semina et al. (2001) reported a single nucleotide insertion in the coding region of the FOXE3 gene in a family with anterior segment ocular dysgenesis and cataracts (OMIM Ref. No. 107250). The mutation caused a frameshift that resulted in an abnormal sequence of 5 terminal amino acids and an addition of 111 amino acids to the predicted protein. The mutation was present in 2 affected individuals from this family and was not identified in 180 normal control chromosomes. Animal model experiments lend further support to the function of FOXE3. Blixt et al. (2000) hypothesized that mutations in Foxe3 could be responsible for the phenotype observed in dysgenetic lens (dyl) mutant mice. In these mice, the lens vesicle fails to separate from the ectoderm, causing a fusion between the

lens and the cornea. Blixt et al. (2000) identified 2 mutations within the DNA-binding domain of Foxe3 in dyl mice: phe93-to-leu and phe98-to-ser. These 2 phenylalanine residues are highly conserved in all forkhead proteins and Blixt et al. (2000) predicted the mutations would obliterate DNA binding.

[26411] It is appreciated that the abovementioned animal model for FOXE3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26412] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26413] Blixt, A.; Mahlapuu, M.; Aitola, M.; Peltö-Huikko, M.; Enerback, S.; Carlsson, P. : A forkhead gene, FoxE3, is essential for lens epithelial proliferation and closure of the lens vesicle. *Genes Dev.* 14: 245–254, 2000. ; and

[26414] Semina, E. V.; Brownell, I.; Mintz-Hittner, H. A.; Murray, J. C.; Jamrich, M. : Mutations in the human forkhead transcription factor FOXE3 associated with anterior segment ocular dysgen.

[26415] Further studies establishing the function and utilities of FOXE3 are found in John Hopkins OMIM database record

ID 601094, and in cited publications numbered 1252 and 12528 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box M1 (FOXM1, Accession NM\_021953) is another VGAM632 host target gene. FOXM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXM1 BINDING SITE, designated SEQ ID:22482, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26416] Another function of VGAM632 is therefore inhibition of Forkhead Box M1 (FOXM1, Accession NM\_021953), a gene which may play a role in the control of cell proliferation. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXM1. The function of FOXM1 has been established by previous studies. The 'forkhead' gene family, originally identified in *Drosophila*, comprises transcription factors with a conserved 100-amino acid DNA-binding motif. One group of factors with the forkhead, or

winged-helix, domain is the hepatocyte nuclear factor-3 family of proteins, which appears to regulate cell-specific transcription in hepatocytes and in respiratory and intestinal epithelia. In an attempt to identify forkhead domain transcription factors involved in intestinal cell differentiation, Ye et al. (1997) isolated FKHL16, which they designated HNF3/forkhead homolog-11 (HFH11), from a human colon carcinoma cell line. On Northern blots, FKHL16 is expressed primarily in thymus, testis, small intestine, and colon, moderately in ovary, and at reduced levels in other tissues. Ye et al. (1997) found 2 alternatively spliced FKHL16 mRNAs, yielding predicted proteins of 801 (OMIM Ref. No. HFH11A) and 748 (OMIM Ref. No. HFH11B) amino acids. Both isoforms contain 2 PEST regions, associated with rapid protein degradation. Expression studies in mouse revealed that Fkhl16 is transcribed broadly in embryos, but is expressed only in adult organs containing proliferating cells involved in replenishing differentiated cell populations or in response to growth factors released during injury or repair. By analyzing the promoter region of human FKHL16, or TRIDENT, Korver et al. (1997) found that the 300 bp upstream of the transcription start site are essential for the cell cycle-specific expression of

FKHL16. They stated that the promoter data in combination with the expression of FKHL16 in cycling, but not resting, cells indicate that this protein is likely to play a role in the control of cell proliferation. By analysis of cDNA microarrays, Ly et al. (2000) showed that diminished proliferation exhibited by fibroblasts from either elderly patients or patients with Hutchinson–Gilford progeria (OMIM Ref. No. 176670) was associated with reduced expression of cell cycle genes as well as a decline in FOXM1B (OMIM Ref. No. HFH11B) levels. Wang et al. (2001) showed that increased levels of Foxm1b in regenerating liver of old transgenic mice restored the sharp peaks in hepatocyte DNA replication and mitosis that are the hallmarks of young regenerating mouse liver. Restoration of the young regenerating liver phenotype was associated with increased expression of numerous cell cycle regulatory genes. Cotransfection assays in the human hepatoma HepG2 cell line demonstrated that FOXM1B protein stimulated expression of both the cyclin B1 (OMIM Ref. No. 123836) and cyclin D1 (OMIM Ref. No. 168461) promoters, suggesting that these cyclin genes are a direct FOXM1B transcription target. The results suggested that FOXM1B controls the transcription network of genes that

are essential for cell division and exit from mitosis. The results indicated that reduced expression of the FOXM1B transcription factor contributes to the decline in cellular proliferation observed in the aging process.

[26417] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26418] Westendorf, J. M.; Rao, P. N.; Gerace, L. : Cloning of cDNAs for M-phase phosphoproteins recognized by the MPM2 monoclonal antibody and determination of the phosphorylated epitope. Proc. Nat. Acad. Sci. 91: 714–718, 1994. ; and

[26419] Yao, K.–M.; Sha, M.; Lu, Z.; Wong, G. G. : Molecular analysis of a novel winged helix protein, WIN: expression pattern, DNA binding property, and alternative splicing within the DNA bin.

[26420] Further studies establishing the function and utilities of FOXM1 are found in John Hopkins OMIM database record ID 602341, and in cited publications numbered 6306–630 and 6311 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Galanin (GAL, Accession XM\_166189) is another VGAM632 host target gene. GAL BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by GAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAL BINDING SITE, designated SEQ ID:43999, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26421] Another function of VGAM632 is therefore inhibition of Galanin (GAL, Accession XM\_166189), a gene which stimulates LH secretion and enhances LHRH-induced LH release from dispersed anterior pituitary cells in vitro. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAL. The function of GAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514. Potassium Channel, Subfamily K, Member 7 (KCNK7, Accession NM\_033456) is another VGAM632 host target gene. KCNK7 BINDING SITE1 through KCNK7 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KCNK7, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK7 BINDING SITE1 through KCNK7 BINDING SITE4, designated SEQ ID:27254, SEQ ID:27199, SEQ ID:27200 and SEQ ID:12268 respectively, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26422] Another function of VGAM632 is therefore inhibition of Potassium Channel, Subfamily K, Member 7 (KCNK7, Accession NM\_033456). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK7. Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406) is another VGAM632 host target gene. MGAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT1 BINDING SITE, designated SEQ ID:8226, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ

ID:3343.

[26423] Another function of VGAM632 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406), a gene which exists as a single protein-encoding exon. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT1. The function of MGAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165. Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM\_000276) is another VGAM632 host target gene. OCRL BINDING SITE1 and OCRL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OCRL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCRL BINDING SITE1 and OCRL BINDING SITE2, designated SEQ ID:5818 and SEQ ID:7305 respectively, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26424] Another function of VGAM632 is therefore inhibition of Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM\_000276). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCRL. Src-like-adaptor 2 (SLA2, Accession NM\_032214) is another VGAM632 host target gene. SLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLA2 BINDING SITE, designated SEQ ID:25943, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26425] Another function of VGAM632 is therefore inhibition of Src-like-adaptor 2 (SLA2, Accession NM\_032214). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA2. Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769) is another VGAM632 host target gene. C11orf11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by C11orf11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf11 BINDING SITE, designated SEQ ID:44789, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26426] Another function of VGAM632 is therefore inhibition of Chromosome 11 Open Reading Frame 11 (C11orf11, Accession XM\_167769). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf11. CGI-203 (Accession NM\_020408) is another VGAM632 host target gene. CGI-203 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGI-203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-203 BINDING SITE, designated SEQ ID:21675, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26427] Another function of VGAM632 is therefore inhibition of

CGI-203 (Accession NM\_020408). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-203. KIAA0222 (Accession NM\_014643) is another VGAM632 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16046, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26428] Another function of VGAM632 is therefore inhibition of KIAA0222 (Accession NM\_014643). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. KIAA1915 (Accession XM\_055481) is another VGAM632 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36274, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26429] Another function of VGAM632 is therefore inhibition of KIAA1915 (Accession XM\_055481). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1915. Quiescin Q6 (QSCN6, Accession NM\_002826) is another VGAM632 host target gene. QSCN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by QSCN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QSCN6 BINDING SITE, designated SEQ ID:8698, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26430] Another function of VGAM632 is therefore inhibition of Quiescin Q6 (QSCN6, Accession NM\_002826). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QSCN6. UCK1 (Accession NM\_031432) is an-

other VGAM632 host target gene. UCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCK1 BINDING SITE, designated SEQ ID:25429, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26431] Another function of VGAM632 is therefore inhibition of UCK1 (Accession NM\_031432). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCK1. LOC149134 (Accession XM\_097594) is another VGAM632 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:40960, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26432] Another function of VGAM632 is therefore inhibition of LOC149134 (Accession XM\_097594). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC149837 (Accession XM\_097747) is another VGAM632 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41103, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26433] Another function of VGAM632 is therefore inhibition of LOC149837 (Accession XM\_097747). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC151723 (Accession XM\_093395) is another VGAM632 host target gene. LOC151723 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151723, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151723 BINDING SITE, designated SEQ ID:40192, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26434] Another function of VGAM632 is therefore inhibition of LOC151723 (Accession XM\_093395). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151723. LOC157653 (Accession XM\_088353) is another VGAM632 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39636, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26435] Another function of VGAM632 is therefore inhibition of LOC157653 (Accession XM\_088353). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157653. LOC255397 (Accession XM\_173868) is another VGAM632 host target gene. LOC255397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255397 BINDING SITE, designated SEQ ID:46566, to the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, also designated SEQ ID:3343.

[26436] Another function of VGAM632 is therefore inhibition of LOC255397 (Accession XM\_173868). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255397. LOC58525 (Accession XM\_086045) is another VGAM632 host target gene. LOC58525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:38458, to the nucleotide sequence of VGAM632 RNA, herein designated

VGAM RNA, also designated SEQ ID:3343.

[26437] Another function of VGAM632 is therefore inhibition of LOC58525 (Accession XM\_086045). Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 633 (VGAM633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26438] VGAM633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM633 was detected is described hereinabove with reference to Figs. 1–8.

[26439] VGAM633 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Astrovirus. VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26440] VGAM633 gene encodes a VGAM633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM633 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM633 precursor RNA is designated SEQ ID:619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:619 is located at position 2114 relative to the genome of Turkey Astrovirus.

[26441] VGAM633 precursor RNA folds onto itself, forming VGAM633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26442] An enzyme complex designated DICER COMPLEX, `dices` the VGAM633 folded precursor RNA into VGAM633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM633 RNA is designated SEQ ID:3344, and is provided hereinbelow with reference to the sequence listing part.

[26443] VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM633 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[26444] VGAM633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM633 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[26445] The complementary binding of VGAM633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM633 host target RNA into VGAM633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26446] It is appreciated that VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM633 host target genes. The mRNA of

each one of this plurality of VGAM633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM633 RNA, herein designated VGAM RNA, and which when bound by VGAM633 RNA causes inhibition of translation of respective one or more VGAM633 host target proteins.

[26447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM633 gene, herein designated VGAM GENE, on one or more VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[26448] It is yet further appreciated that a function of VGAM633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of viral infection by Turkey Astrovirus. Specific functions, and accordingly utilities, of VGAM633 correlate with, and may be deduced from, the identity of the host target genes which VGAM633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26449] Nucleotide sequences of the VGAM633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM633 are further described hereinbelow with reference to Table 1.

[26450] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM633 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM633 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[26451] As mentioned hereinabove with reference to Fig. 1, a function of VGAM633 gene, herein designated VGAM is inhibition of expression of VGAM633 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM633 correlate with, and may be deduced from, the identity of the target genes which VGAM633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26452] Fibroblast Growth Factor 5 (FGF5, Accession NM\_033143) is a VGAM633 host target gene. FGF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE, designated SEQ ID:26995, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26453] A function of VGAM633 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM\_033143), a gene which induces transformation and may regulate neu-

ronal differentiation. Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM276.Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338) is another VGAM633 host target gene. HIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:11809, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26454] Another function of VGAM633 is therefore inhibition of Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338), a gene which is a membrane protein and interacts with huntingtin. Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP1. The function of HIP1 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM\_003243) is another VGAM633 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9246, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26455] Another function of VGAM633 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM\_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB3. The function of TGFB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM139.FLJ20413 (Accession NM\_017808) is another VGAM633 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:19449, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26456] Another function of VGAM633 is therefore inhibition of FLJ20413 (Accession NM\_017808). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM\_084514) is another VGAM633 host target gene. HSPCAL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPCAL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPCAL3 BINDING SITE, designated SEQ ID:37616, to the nucleotide sequence of VGAM633 RNA,

herein designated VGAM RNA, also designated SEQ ID:3344.

[26457] Another function of VGAM633 is therefore inhibition of Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM\_084514). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPCAL3.

KIAA0608 (Accession XM\_051081) is another VGAM633 host target gene. KIAA0608 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0608 BINDING SITE, designated SEQ ID:35735, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26458] Another function of VGAM633 is therefore inhibition of KIAA0608 (Accession XM\_051081). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0608. KIAA1026 (Accession XM\_048825) is another VGAM633 host target gene. KIAA1026 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35272, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26459] Another function of VGAM633 is therefore inhibition of KIAA1026 (Accession XM\_048825). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. LOC220549 (Accession XM\_167521) is another VGAM633 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44653, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26460] Another function of VGAM633 is therefore inhibition of

LOC220549 (Accession XM\_167521). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC51696 (Accession NM\_016217) is another VGAM633 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18306, to the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, also designated SEQ ID:3344.

[26461] Another function of VGAM633 is therefore inhibition of LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 634 (VGAM634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[26462] VGAM634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM634 was detected is described hereinabove with reference to Figs. 1–8.

[26463] VGAM634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Astrovirus. VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26464] VGAM634 gene encodes a VGAM634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM634 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM634 precursor RNA is designated SEQ ID:620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:620 is located at position 1689 relative to the genome of Turkey Astrovirus.

[26465] VGAM634 precursor RNA folds onto itself, forming VGAM634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[26466] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM634 folded precursor RNA into VGAM634 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 44%) nucleotide se-  
quence of VGAM634 RNA is designated SEQ ID:3345, and  
is provided hereinbelow with reference to the sequence  
listing part.

[26467] VGAM634 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM634 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM634 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[26468] VGAM634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM634 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[26469] The complementary binding of VGAM634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM634 host target RNA into VGAM634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26470] It is appreciated that VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM634 host target genes. The mRNA of each one of this plurality of VGAM634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM634 RNA, herein designated VGAM RNA, and which when bound by VGAM634 RNA causes inhibition of translation of respective one or more VGAM634 host target proteins.

[26471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM634 gene, herein designated VGAM GENE, on one or

more VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26472] It is yet further appreciated that a function of VGAM634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of viral infection by Turkey Astrovirus. Specific functions, and accordingly utilities, of VGAM634 correlate with, and may be deduced from, the identity of the host target genes which VGAM634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [26473] Nucleotide sequences of the VGAM634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM634 are further described hereinbelow with reference to Table 1.
- [26474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM634 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [26475] As mentioned hereinabove with reference to Fig. 1, a function of VGAM634 gene, herein designated VGAM is inhibition of expression of VGAM634 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM634 correlate with, and may be deduced from, the identity of the target genes which VGAM634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [26476] Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3,

Accession NM\_004386) is a VGAM634 host target gene. CSPG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSPG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSPG3 BINDING SITE, designated SEQ ID:10614, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26477] A function of VGAM634 is therefore inhibition of Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM\_004386), a gene which may play a role in modulating cell adhesion and migration. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG3. The function of CSPG3 has been established by previous studies. Neurocan was first described in the early postnatal rat brain where it accounts for 20 to 30% of the total chondroitin sulfate proteoglycan. Rauch et al. (1992) cloned the rat cDNA using degenerate primers based on partial amino acid sequence of immunoaffinity-purified protein. The mouse neurocan cDNA encodes a deduced

1,257-amino acid protein with a predicted molecular mass of 136 kD. The large protein is processed into a smaller form in the adult brain. The predicted protein has a 22-amino acid signal peptide followed by an immunoglobulin-like domain and repeating motifs characteristic of the hyaluronic acid-binding region of aggregating proteoglycans. The C terminus shows approximately 60% identity to the fibroblast and cartilage proteoglycans versican (OMIM Ref. No. 118661) and aggrecan (OMIM Ref. No. 155760). Northern blots detected a 7.5-kb transcript from 4-day and adult rat brains Prange et al. (1998) cloned human neurocan cDNAs from infant and adult brain cDNA libraries. The deduced 1,321-amino acid protein shares 63% sequence identity with both mouse and rat neurocan proteins. Like other known proteoglycans, its N terminus contains an immunoglobulin domain and a series of hyaluronic acid-binding tandem repeats, and its C terminus contains an EGF-like domain, a lectin-like domain, and a complement regulatory-like domain. Northern blot analysis detected expression of a 7.5-kb transcript in fetal and adult tissues from all brain regions tested

[26478] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[26479] Rauch, U.; Grimpe, B.; Kulbe, G.; Arnold–Ammer, I.; Beier, D. R.; Fassler, R. : Structure and chromosomal localization of the mouse neurocan gene. Genomics 28: 405–410, 1995. ; and

[26480] Prange, C. K.; Pennacchio, L. A.; Lieuallen, K.; Fan, W.; Lennon, G. G. : Characterization of the human neurocan gene, CSPG3. Gene 221: 199–205, 1998.

[26481] Further studies establishing the function and utilities of CSPG3 are found in John Hopkins OMIM database record ID 600826, and in cited publications numbered 7779–7782 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434) is another VGAM634 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44336, to the nucleotide sequence of

VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26482] Another function of VGAM634 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010) is another VGAM634 host target gene. ESRRBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:19741, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26483] Another function of VGAM634 is therefore inhibition of

Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1. Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM\_005311) is another VGAM634 host target gene. GRB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB10 BINDING SITE, designated SEQ ID:11788, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26484] Another function of VGAM634 is therefore inhibition of Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM\_005311), a gene which plays a functional role in insulin and IGF-I signaling. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRB10. The function of GRB10 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM441. Interleukin 1, Alpha (IL1A, Accession XM\_031221) is another VGAM634 host target gene. IL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1A BINDING SITE, designated SEQ ID:31308, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26485] Another function of VGAM634 is therefore inhibition of Interleukin 1, Alpha (IL1A, Accession XM\_031221), a gene which stimulates thymocyte proliferation by inducing il-2 release, b-cell maturation & proliferation, & fibroblast growth factor activity. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1A. The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. IRTA1 (Accession NM\_031282) is another VGAM634 host target gene. IRTA1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by IRTA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA1 BINDING SITE, designated SEQ ID:25303, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26486] Another function of VGAM634 is therefore inhibition of IRTA1 (Accession NM\_031282). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA1. Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102) is another VGAM634 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14411, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26487] Another function of VGAM634 is therefore inhibition of

Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.RNA (guanine–7–) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM634 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9892, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26488] Another function of VGAM634 is therefore inhibition of RNA (guanine–7–) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN– at the guanine N7 position. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.RU2 (Accession NM\_016356) is another VGAM634 host target gene. RU2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RU2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RU2 BINDING SITE, designated SEQ ID:18494, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26489] Another function of VGAM634 is therefore inhibition of RU2 (Accession NM\_016356), a gene which expressed ubiquitously, potentially useful antigens for cancer immunotherapy cannot be predicted from the sequence of the normal cellular protein. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RU2. The function of RU2 has been established by previous studies. Tumor antigens recognized by cytolytic T cells (CTLs) can

be classified into 4 groups: shared tumor-specific antigens encoded by MAGE-type genes (e.g., MAGEA1; 300016) that are silent in most normal tissues and expressed in many tumors; differentiation antigens that are also expressed in normal cells; antigens resulting from tumor-specific point mutations; and antigens overexpressed in tumor cells. By screening cells expressing both HLA-B7 and kidney tumor cell RNA with autologous CTLs, followed by PCR, van den Eynde et al. (1999) obtained cDNAs encoding RU2, which is identical to the KIAA1154 gene identified by Hirosawa et al. (1999). Genomic sequence analysis determined that RU2 is transcribed as a 'normal' gene, resulting in a sense transcript (RU2S), and in the opposite direction, resulting in a shorter antisense transcript (RU2AS) found in tumors. Testing of synthetic peptides determined that the tumor antigen binding to HLA-B7 has the sequence LPRWPPPQL. Northern blot analysis revealed that the full-length gene is expressed as a 2.2-kb transcript. RT-PCR analysis detected ubiquitous expression of the full-length RU2S transcript, but expression of the RU2AS transcript was restricted to normal kidney, bladder, liver, and testis, as well as tumors of various histologic origins. The deduced RU2S protein contains

476 amino acids, while the RU2AS protein contains 84 residues. Van den Eynde et al. (1999) concluded that potentially useful antigens for cancer immunotherapy cannot be predicted from the sequence of the normal cellular protein. Using FISH, van den Eynde et al. (1999) mapped the RU2 gene to 6p22.1.

[26490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26491] Hirosawa, M.; Nagase, T.; Ishikawa, K.; Kikuno, R.; Nomura, N.; Ohara, O. : Characterization of cDNA clones selected by the GeneMark analysis from size-fractionated cDNA libraries from human brain. DNA Res. 6: 329–336, 1999. ; and

[26492] van den Eynde, B. J.; Gaugler, B.; Probst-Kepper, M.; Michaux, L.; Devuyst, O.; Lorge, F.; Weynants, P.; Boon, T. : A new antigen recognized by cytolytic T lymphocytes on a human kidney.

[26493] Further studies establishing the function and utilities of RU2 are found in John Hopkins OMIM database record ID 605755, and in cited publications numbered 7480 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TRAM (Accession

NM\_014294) is another VGAM634 host target gene. TRAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAM BINDING SITE, designated SEQ ID:15592, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26494] Another function of VGAM634 is therefore inhibition of TRAM (Accession NM\_014294). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM. Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336) is another VGAM634 host target gene. UBE2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2A BINDING SITE, designated SEQ ID:9343, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ

ID:3345.

[26495] Another function of VGAM634 is therefore inhibition of Ubiquitin-conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM\_003336), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv-damaged dna. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2A. The function of UBE2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM294.ADAM-like, Decysin 1 (ADAMDEC1, Accession NM\_014479) is another VGAM634 host target gene. ADAMDEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMDEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMDEC1 BINDING SITE, designated SEQ ID:15824, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26496] Another function of VGAM634 is therefore inhibition of

ADAM-like, Decysin 1 (ADAMDEC1, Accession NM\_014479). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMDEC1. APCL (Accession NM\_005883) is another VGAM634 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12496, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26497] Another function of VGAM634 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. Rho GTPase Activating Protein 8 (ARHGAP8, Accession NM\_017701) is another VGAM634 host target gene. ARHGAP8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP8 BINDING SITE, designated SEQ ID:19274, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26498] Another function of VGAM634 is therefore inhibition of Rho GTPase Activating Protein 8 (ARHGAP8, Accession NM\_017701). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP8. BCAA (Accession NM\_016374) is another VGAM634 host target gene. BCAA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCAA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAA BINDING SITE, designated SEQ ID:18514, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26499] Another function of VGAM634 is therefore inhibition of BCAA (Accession NM\_016374). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAA.

CAMP-GEFII (Accession NM\_007023) is another VGAM634 host target gene. CAMP-GEFII BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMP-GEFII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMP-GEFII BINDING SITE, designated SEQ ID:13880, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26500] Another function of VGAM634 is therefore inhibition of CAMP-GEFII (Accession NM\_007023). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMP-GEFII. Cytoskeleton-associated Protein 4 (CKAP4, Accession NM\_006825) is another VGAM634 host target gene. CKAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP4 BINDING SITE, designated SEQ ID:13703, to the nucleotide sequence of VGAM634 RNA,

herein designated VGAM RNA, also designated SEQ ID:3345.

[26501] Another function of VGAM634 is therefore inhibition of Cytoskeleton-associated Protein 4 (CKAP4, Accession NM\_006825). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP4. DKFZp434E0519 (Accession NM\_032247) is another VGAM634 host target gene. DKFZp434E0519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434E0519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E0519 BINDING SITE, designated SEQ ID:25985, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26502] Another function of VGAM634 is therefore inhibition of DKFZp434E0519 (Accession NM\_032247). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E0519. FLJ11078 (Accession NM\_018316) is another VGAM634 host target gene. FLJ11078 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11078 BINDING SITE, designated SEQ ID:20310, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26503] Another function of VGAM634 is therefore inhibition of FLJ11078 (Accession NM\_018316). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11078. FLJ12783 (Accession NM\_031426) is another VGAM634 host target gene. FLJ12783 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25421, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26504] Another function of VGAM634 is therefore inhibition of

FLJ12783 (Accession NM\_031426). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ14327 (Accession NM\_024912) is another VGAM634 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24422, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26505] Another function of VGAM634 is therefore inhibition of FLJ14327 (Accession NM\_024912). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ20345 (Accession NM\_017777) is another VGAM634 host target gene. FLJ20345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20345 BINDING SITE, designated SEQ ID:19406, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26506] Another function of VGAM634 is therefore inhibition of FLJ20345 (Accession NM\_017777). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20345. FLJ21369 (Accession NM\_024802) is another VGAM634 host target gene. FLJ21369 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:24184, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26507] Another function of VGAM634 is therefore inhibition of FLJ21369 (Accession NM\_024802). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369. FLJ23233 (Accession NM\_024691) is another VGAM634

host target gene. FLJ23233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23233 BINDING SITE, designated SEQ ID:24001, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26508] Another function of VGAM634 is therefore inhibition of FLJ23233 (Accession NM\_024691). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23233. KIAA0993 (Accession XM\_034413) is another VGAM634 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32084, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26509] Another function of VGAM634 is therefore inhibition of KIAA0993 (Accession XM\_034413). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1040 (Accession XM\_051091) is another VGAM634 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35746, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26510] Another function of VGAM634 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1069 (Accession XM\_042635) is another VGAM634 host target gene. KIAA1069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1069 BINDING SITE, designated SEQ ID:33728, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26511] Another function of VGAM634 is therefore inhibition of KIAA1069 (Accession XM\_042635). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1069. KIAA1613 (Accession XM\_035946) is another VGAM634 host target gene. KIAA1613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1613, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1613 BINDING SITE, designated SEQ ID:32361, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26512] Another function of VGAM634 is therefore inhibition of KIAA1613 (Accession XM\_035946). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1613. MGC2550 (Accession NM\_024071) is another VGAM634 host target gene. MGC2550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2550 BINDING SITE, designated SEQ ID:23500, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26513] Another function of VGAM634 is therefore inhibition of MGC2550 (Accession NM\_024071). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2550. MGC26954 (Accession NM\_145025) is another VGAM634 host target gene. MGC26954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26954 BINDING SITE, designated SEQ ID:29640, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26514] Another function of VGAM634 is therefore inhibition of MGC26954 (Accession NM\_145025). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26954. PRO0365 (Accession NM\_014126) is another VGAM634 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15391, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM

RNA, also designated SEQ ID:3345.

[26515] Another function of VGAM634 is therefore inhibition of PRO0365 (Accession NM\_014126). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. SGP28 (Accession NM\_006061) is another VGAM634 host target gene. SGP28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SGP28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGP28 BINDING SITE, designated SEQ ID:12704, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26516] Another function of VGAM634 is therefore inhibition of SGP28 (Accession NM\_006061). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGP28. LOC120856 (Accession XM\_058509) is another VGAM634 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36645, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26517] Another function of VGAM634 is therefore inhibition of LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC144079 (Accession XM\_084711) is another VGAM634 host target gene. LOC144079 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144079 BINDING SITE, designated SEQ ID:37674, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26518] Another function of VGAM634 is therefore inhibition of LOC144079 (Accession XM\_084711). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC144079. LOC146184 (Accession XM\_096942) is another VGAM634 host target gene. LOC146184 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146184 BINDING SITE, designated SEQ ID:40660, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26519] Another function of VGAM634 is therefore inhibition of LOC146184 (Accession XM\_096942). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146184. LOC147077 (Accession XM\_085699) is another VGAM634 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38295, to

the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26520] Another function of VGAM634 is therefore inhibition of LOC147077 (Accession XM\_085699). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC148046 (Accession XM\_097375) is another VGAM634 host target gene. LOC148046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148046 BINDING SITE, designated SEQ ID:40865, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26521] Another function of VGAM634 is therefore inhibition of LOC148046 (Accession XM\_097375). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148046. LOC152674 (Accession XM\_098251) is another VGAM634 host target gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41541, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26522] Another function of VGAM634 is therefore inhibition of LOC152674 (Accession XM\_098251). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC153222 (Accession XM\_087631) is another VGAM634 host target gene. LOC153222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153222 BINDING SITE, designated SEQ ID:39368, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26523] Another function of VGAM634 is therefore inhibition of LOC153222 (Accession XM\_087631). Accordingly, utilities

of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153222. LOC153711 (Accession XM\_098419) is another VGAM634 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41669, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26524] Another function of VGAM634 is therefore inhibition of LOC153711 (Accession XM\_098419). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC157624 (Accession XM\_098801) is another VGAM634 host target gene. LOC157624 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157624 BINDING SITE, designated SEQ ID:41828, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26525] Another function of VGAM634 is therefore inhibition of LOC157624 (Accession XM\_098801). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157624. LOC157867 (Accession XM\_098831) is another VGAM634 host target gene. LOC157867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157867 BINDING SITE, designated SEQ ID:41855, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26526] Another function of VGAM634 is therefore inhibition of LOC157867 (Accession XM\_098831). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157867. LOC196264 (Accession XM\_113683) is another VGAM634 host target gene. LOC196264 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42338, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26527] Another function of VGAM634 is therefore inhibition of LOC196264 (Accession XM\_113683). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC219899 (Accession XM\_166173) is another VGAM634 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43994, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26528] Another function of VGAM634 is therefore inhibition of

LOC219899 (Accession XM\_166173). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219899. LOC253187 (Accession XM\_173139) is another VGAM634 host target gene. LOC253187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253187 BINDING SITE, designated SEQ ID:46394, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26529] Another function of VGAM634 is therefore inhibition of LOC253187 (Accession XM\_173139). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253187. LOC90750 (Accession XM\_033868) is another VGAM634 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31972, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26530] Another function of VGAM634 is therefore inhibition of LOC90750 (Accession XM\_033868). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. LOC91133 (Accession XM\_036372) is another VGAM634 host target gene. LOC91133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91133 BINDING SITE, designated SEQ ID:32431, to the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, also designated SEQ ID:3345.

[26531] Another function of VGAM634 is therefore inhibition of LOC91133 (Accession XM\_036372). Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91133. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 635 (VGAM635) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26532] VGAM635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM635 was detected is described hereinabove with reference to Figs. 1–8.

[26533] VGAM635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry Mottle Leaf Virus. VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26534] VGAM635 gene encodes a VGAM635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM635 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM635 precursor RNA is designated SEQ ID:621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:621 is

located at position 457 relative to the genome of Cherry Mottle Leaf Virus.

[26535] VGAM635 precursor RNA folds onto itself, forming VGAM635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26536] An enzyme complex designated DICER COMPLEX, `dices` the VGAM635 folded precursor RNA into VGAM635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM635 RNA is designated SEQ ID:3346, and is provided hereinbelow with reference to the sequence listing part.

[26537] VGAM635 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM635 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[26538] VGAM635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM635 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM635 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26539] The complementary binding of VGAM635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM635 host target RNA into VGAM635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26540] It is appreciated that VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM635 host target genes. The mRNA of each one of this plurality of VGAM635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM635 RNA, herein designated VGAM RNA, and which when bound by VGAM635 RNA causes inhibition of translation of respective one or more VGAM635

host target proteins.

[26541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM635 gene, herein designated VGAM GENE, on one or more VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26542] It is yet further appreciated that a function of VGAM635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of viral infection by Cherry Mottle Leaf Virus.

Specific functions, and accordingly utilities, of VGAM635 correlate with, and may be deduced from, the identity of the host target genes which VGAM635 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26543] Nucleotide sequences of the VGAM635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM635 are further described hereinbelow with reference to Table 1.

[26544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM635 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26545] As mentioned hereinabove with reference to Fig. 1, a function of VGAM635 gene, herein designated VGAM is inhibition of expression of VGAM635 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM635 correlate with, and may be deduced from, the identity of the target genes which VGAM635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26546] MGC5370 (Accession NM\_032739) is a VGAM635 host target gene. MGC5370 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5370 BINDING SITE, designated SEQ ID:26469, to the nucleotide sequence of VGAM635 RNA, herein designated VGAM RNA, also designated SEQ ID:3346.

[26547] A function of VGAM635 is therefore inhibition of MGC5370 (Accession NM\_032739). Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5370. LOC139522 (Accession XM\_066738) is another VGAM635 host target gene. LOC139522 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139522, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139522 BINDING SITE, designated SEQ ID:37344, to the nucleotide sequence of VGAM635 RNA, herein designated VGAM RNA, also designated SEQ ID:3346.

[26548] Another function of VGAM635 is therefore inhibition of LOC139522 (Accession XM\_066738). Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139522. LOC158382 (Accession XM\_098931) is another VGAM635 host target gene. LOC158382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158382 BINDING SITE, designated SEQ ID:41965, to the nucleotide sequence of VGAM635 RNA, herein designated VGAM RNA, also designated SEQ ID:3346.

[26549] Another function of VGAM635 is therefore inhibition of LOC158382 (Accession XM\_098931). Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158382. LOC219920 (Accession XM\_167787) is another VGAM635 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44805, to the nucleotide sequence of VGAM635 RNA, herein designated VGAM RNA, also designated SEQ ID:3346.

[26550] Another function of VGAM635 is therefore inhibition of LOC219920 (Accession XM\_167787). Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC63928 (Accession NM\_022097) is another VGAM635 host target gene. LOC63928 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC63928, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63928 BINDING SITE, designated SEQ ID:22637, to the nucleotide sequence of VGAM635 RNA, herein designated

VGAM RNA, also designated SEQ ID:3346.

[26551] Another function of VGAM635 is therefore inhibition of LOC63928 (Accession NM\_022097). Accordingly, utilities of VGAM635 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63928. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 636 (VGAM636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26552] VGAM636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM636 was detected is described hereinabove with reference to Figs. 1–8.

[26553] VGAM636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry Mottle Leaf Virus. VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26554] VGAM636 gene encodes a VGAM636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM636 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM636 precursor RNA is designated SEQ ID:622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:622 is located at position 3861 relative to the genome of Cherry Mottle Leaf Virus.

[26555] VGAM636 precursor RNA folds onto itself, forming VGAM636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26556] An enzyme complex designated DICER COMPLEX, `dices` the VGAM636 folded precursor RNA into VGAM636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM636 RNA is designated SEQ ID:3347, and is provided hereinbelow with reference to the sequence listing part.

[26557] VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM636 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26558] VGAM636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM636 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26559] The complementary binding of VGAM636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM636 host target RNA into VGAM636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26560] It is appreciated that VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM636 host target genes. The mRNA of

each one of this plurality of VGAM636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM636 RNA, herein designated VGAM RNA, and which when bound by VGAM636 RNA causes inhibition of translation of respective one or more VGAM636 host target proteins.

[26561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM636 gene, herein designated VGAM GENE, on one or more VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[26562] It is yet further appreciated that a function of VGAM636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of viral infection by Cherry Mottle Leaf Virus. Specific functions, and accordingly utilities, of VGAM636 correlate with, and may be deduced from, the identity of the host target genes which VGAM636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26563] Nucleotide sequences of the VGAM636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM636 are further described hereinbelow with reference to Table 1.

[26564] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM636 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM636 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[26565] As mentioned hereinabove with reference to Fig. 1, a function of VGAM636 gene, herein designated VGAM is inhibition of expression of VGAM636 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM636 correlate with, and may be deduced from, the identity of the target genes which VGAM636 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26566] Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM\_000151) is a VGAM636 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5661, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26567] A function of VGAM636 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I,

von Gierke disease) (G6PC, Accession NM\_000151). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. Membrane-spanning 4-domains, Subfamily A, Member 2 (Fc fragment of IgE, high affinity I, receptor for; beta polypeptide) (MS4A2, Accession NM\_021950) is another VGAM636 host target gene. MS4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A2 BINDING SITE, designated SEQ ID:22477, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26568] Another function of VGAM636 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 2 (Fc fragment of IgE, high affinity I, receptor for; beta polypeptide) (MS4A2, Accession NM\_021950), a gene which binds to the fc region of immunoglobulins epsilon. Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with MS4A2. The function of MS4A2 has been established by previous studies. Shirakawa et al. (1994) reported a significant association between atopy and substitution of a leucine for an isoleucine at position 181 of the FCER1B gene product. Hizawa et al. (1995) failed to find this leu181-to-ile substitution. Folster-Holst et al. (1998) presented evidence from linkage studies in 12 families with atopic dermatitis for linkage in close proximity to the marker D11S903. The method of analysis suggested an oligogenic mode of inheritance as well as heterogeneity in the genetic susceptibility to atopy and atopic dermatitis; only 2 of 12 families showed evidence for linkage using the oligogenic model.

[26569] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26570] Folster-Holst, R.; Moises, H. W.; Yang, L.; Fritsch, W.; Weissenbach, J.; Christophers, E. : Linkage between atopy and the IgE high-affinity receptor gene at 11q13 in atopic dermatitis families. Hum. Genet. 102: 236-239, 1998. ; and

[26571] Shirakawa, T.; Li, A.; Dubowitz, M.; Dekker, J. W.; Shaw, A. E.; Faux, J. A.; Ra, C.; Cookson, W. O. C. M.; Hopkin, J. M. :

Association between atopy and variants of the beta sub-unit of.

[26572] Further studies establishing the function and utilities of MS4A2 are found in John Hopkins OMIM database record ID 147138, and in cited publications numbered 11465–11466, 3386, 11467–11469, 338 and 11470–11472 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oxytocin Receptor (OXTR, Accession NM\_000916) is another VGAM636 host target gene. OXTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:6623, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26573] Another function of VGAM636 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM\_000916), a gene which induces inward ion currents. Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The

function of OXTR has been established by previous studies. Just before the onset of labor, uterine muscle becomes exceedingly sensitive to oxytocin, for which it is a primary target tissue, because of a dramatic increase in the number of oxytocin receptors. Kimura et al. (1992) reported the structure and expression of the human oxytocin receptor cDNA isolated by expression cloning. The encoded receptor was a 388-amino acid polypeptide with 7 transmembrane domains typical of G protein-coupled receptors. The oxytocin receptor, expressed in *Xenopus* oocytes, specifically responded to oxytocin and induced an inward membrane current. Messenger RNAs for the receptor were of 2 sizes, 3.6 kb in breast and 4.4 kb in ovary, endometrium, and myometrium. The mRNA level in myometrium was very high at term. Yang et al. (2002) found that mutation of lysine-270 (K270) in wildtype OTR completely abolished the ability of the receptor to stimulate phosphatidylinositide turnover, with only a small reduction in ligand affinity. These data demonstrated that OTR K270 is critically important in the stimulation by OTR of phosphatidylinositide turnover. Mutation of K270 also adversely affected the ability of OTR to stimulate ERK1/2 (601795, 176948) phosphorylation. Therefore, this

residue plays an important role in the specificity of OTR/G- $\alpha$ -q (OMIM Ref. No. 600998)/PLC (see OMIM Ref. No. 602142) coupling.

[26574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26575] Kimura, T.; Tanizawa, O.; Mori, K.; Brownstein, M. J.; Okayama, H. : Structure and expression of a human oxytocin receptor. *Nature* 356: 526–529, 1992. ; and

[26576] Yang, M.; Wang, W.; Zhong, M.; Philippi, A.; Lichtarge, O.; Sanborn, B. M. : Lysine 270 in the third intracellular domain of the oxytocin receptor is an important determinant for G- $\alpha$ ph.

[26577] Further studies establishing the function and utilities of OXTR are found in John Hopkins OMIM database record ID 167055, and in cited publications numbered 3154–3157 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155) is another VGAM636 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10365, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26578] Another function of VGAM636 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Wingless-type MMTV Integration Site Family, Member 8B (WNT8B, Accession XM\_005702) is another VGAM636 host target gene. WNT8B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT8B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of WNT8B BINDING SITE, designated SEQ ID:29984, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26579] Another function of VGAM636 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 8B (WNT8B, Accession XM\_005702), a gene which is the ligand for members of the frizzled family of seven trans-membrane receptors and may play an important role in the development and differentiation of certain forebrain structures. Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT8B. The function of WNT8B has been established by previous studies. WNT genes encode intercellular signaling glycoproteins that play important roles in key processes of embryonic development such as mesoderm induction, specification of the embryonic axis, and patterning of the central nervous system, spinal cord, and limbs. The name WNT denotes the relationship of this family to the *Drosophila* segment polarity gene 'wingless,' and to its vertebrate ortholog Int1, a mouse protooncogene; see WNT1 (OMIM Ref. No.

164820). Lako et al. (1996) noted that multiple WNT genes are known to exist in several species that have been investigated ranging from *Drosophila* to man. They have been classified into various groups and subgroups on the basis of high sequence homology and common expression patterns. The vertebrate WNT8 subfamily includes genes from *Xenopus*, zebrafish, and chicken; Lako et al. (1996) characterized the first mammalian WNT8 homolog, a human member of the Wnt8 family that they termed WNT8B on the basis of the very high sequence similarity (approximately 90% identity) of the inferred protein to those encoded by the *Xenopus* and zebrafish Wnt8b genes. The human cDNA encodes a polypeptide that contains a C2H2 zinc finger-like motif. Lako et al. (1998) presented the full-length cDNA sequence and genomic organization of the human WNT8B gene and reported studies of expression of the gene in human and mouse embryos. The WNT8B gene contains 6 exons separated by small introns, with the exception of intron 1. The predicted protein has 351 amino acids. The gene is expressed predominantly as a transcript of approximately 2.1 kb. The human and mouse expression patterns appeared to be identical and were restricted to the developing brain, with the

great majority of expression being found in the developing forebrain. In the latter case, expression was confined to the germinative neuroepithelium of 3 sharply delimited regions: the dorsomedial wall of the telencephalic ventricles (which includes the developing hippocampus), a discrete region of the dorsal thalamus, and the mammillary and retromammillary regions of the posterior hypothalamus. Expression in the developing hippocampus may suggest a role for WNT8B in patterning of this region. By use of PCR typing of a human monochromosomal hybrid cell panel, Lako et al. (1996) mapped the WNT8B gene to chromosome 10. They refined the localization to 10q24 by fluorescence in situ hybridization. Lako et al. (1998) suggested WNT8B as a candidate gene for partial epilepsy (EPT; 600512) in families in which the disease has been linked to markers in the 10q23–q24 region.

[26580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26581] Lako, M.; Lindsay, S.; Bullen, P.; Wilson, D. I.; Robson, S. C.; Strachan, T. : A novel mammalian Wnt gene, WNT8B, shows brain–restricted expression in early development, with sharply delimited expression boundaries in the de–

veloping forebrain. Hum. Molec. Genet. 7: 813–822, 1998.

; and

[26583] Further studies establishing the function and utilities of WNT8B are found in John Hopkins OMIM database record ID 601396, and in cited publications numbered 6652–6653 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0976 (Accession NM\_014917) is another VGAM636 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17169, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26584] Another function of VGAM636 is therefore inhibition of KIAA0976 (Accession NM\_014917). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0976. Smith–Magenis Syndrome Chromosome Region, Candidate 7 (SMCR7, Accession NM\_139162) is another VGAM636 host target gene. SMCR7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR7 BINDING SITE, designated SEQ ID:29170, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26585] Another function of VGAM636 is therefore inhibition of Smith–Magenis Syndrome Chromosome Region, Candidate 7 (SMCR7, Accession NM\_139162). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR7. LOC138307 (Accession XM\_059963) is another VGAM636 host target gene. LOC138307 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen–

tarity of the nucleotide sequences of LOC138307 BINDING SITE, designated SEQ ID:37124, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26586] Another function of VGAM636 is therefore inhibition of LOC138307 (Accession XM\_059963). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138307. LOC146316 (Accession XM\_027568) is another VGAM636 host target gene. LOC146316 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146316 BINDING SITE, designated SEQ ID:30524, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26587] Another function of VGAM636 is therefore inhibition of LOC146316 (Accession XM\_027568). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146316. LOC157226 (Accession XM\_033876) is an-

other VGAM636 host target gene. LOC157226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31978, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26588] Another function of VGAM636 is therefore inhibition of LOC157226 (Accession XM\_033876). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. LOC158714 (Accession XM\_088650) is another VGAM636 host target gene. LOC158714 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158714 BINDING SITE, designated SEQ ID:39884, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26589] Another function of VGAM636 is therefore inhibition of LOC158714 (Accession XM\_088650). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158714. LOC254082 (Accession XM\_173165) is another VGAM636 host target gene. LOC254082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254082 BINDING SITE, designated SEQ ID:46422, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26590] Another function of VGAM636 is therefore inhibition of LOC254082 (Accession XM\_173165). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254082. LOC51634 (Accession NM\_016024) is another VGAM636 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:18101, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26591] Another function of VGAM636 is therefore inhibition of LOC51634 (Accession NM\_016024). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. LOC92017 (Accession XM\_042234) is another VGAM636 host target gene. LOC92017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:33711, to the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, also designated SEQ ID:3347.

[26592] Another function of VGAM636 is therefore inhibition of LOC92017 (Accession XM\_042234). Accordingly, utilities of VGAM636 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 637 (VGAM637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26593] VGAM637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM637 was detected is described hereinabove with reference to Figs. 1–8.

[26594] VGAM637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Frog Adenovirus 1. VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26595] VGAM637 gene encodes a VGAM637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM637 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM637 precursor RNA is designated SEQ ID:623, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:623 is located at position 5382 relative to the genome of Frog Adenovirus 1.

[26596] VGAM637 precursor RNA folds onto itself, forming VGAM637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM637 folded precursor RNA into VGAM637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM637 RNA is designated SEQ ID:3348, and is provided hereinbelow with reference to the sequence listing part.

[26598] VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM637 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26599] VGAM637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM637 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26600] The complementary binding of VGAM637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM637 host target RNA into VGAM637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26601] It is appreciated that VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM637 host target genes. The mRNA of each one of this plurality of VGAM637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM637 RNA, herein designated VGAM RNA, and which when bound by VGAM637 RNA causes in-

hibition of translation of respective one or more VGAM637 host target proteins.

[26602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM637 gene, herein designated VGAM GENE, on one or more VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26603] It is yet further appreciated that a function of VGAM637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM637 include diagnosis, prevention and

treatment of viral infection by Frog Adenovirus 1. Specific functions, and accordingly utilities, of VGAM637 correlate with, and may be deduced from, the identity of the host target genes which VGAM637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26604] Nucleotide sequences of the VGAM637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM637 are further described hereinbelow with reference to Table 1.

[26605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM637 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM637 gene, herein designated VGAM is inhibition of expression of VGAM637 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM637 correlate with, and may be deduced from, the identity of the target genes which VGAM637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26607] FREB (Accession NM\_032738) is a VGAM637 host target gene. FREB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FREB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREB BINDING SITE, designated SEQ ID:26465, to the nucleotide sequence of VGAM637 RNA, herein designated VGAM RNA, also designated SEQ ID:3348.

[26608] A function of VGAM637 is therefore inhibition of FREB (Accession NM\_032738). Accordingly, utilities of VGAM637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREB. Tumor Necrosis Factor (ligand) Superfamily, Member 10 (TNFSF10, Accession NM\_003810) is another VGAM637 host target gene. TNFSF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF10, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF10 BINDING SITE, designated SEQ ID:9899, to the nucleotide sequence of VGAM637 RNA, herein designated VGAM RNA, also designated SEQ ID:3348.

[26609] Another function of VGAM637 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 10 (TNFSF10, Accession NM\_003810), a gene which mediates cell death. Accordingly, utilities of VGAM637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF10. The function of TNFSF10 has been established by previous studies. Degli-Esposti et al. (1997) noted that TRAIL can induce apoptosis in a wide variety of transformed cell lines of diverse lineage, but does not appear to kill normal cells even though TRAIL mRNA is expressed at significant levels in most normal tissues. They suggested that the regulation of TRAIL function takes place at the level of receptor expression. The TRAIL receptors TRAILR1, also called DR4 (OMIM Ref. No. 603611), and TRAILR2, also called DR5 (OMIM Ref. No. 603612), are capable of mediating apoptosis. Two other receptors, TRAILR3 (OMIM Ref. No.

603613) and TRAILR4 (OMIM Ref. No. 603614), do not signal apoptosis and are potential decoy receptors for TRAIL. Cell death induced by TRAIL had been believed to occur exclusively in tumor cells, suggesting that this drug was safe to use as an antitumor therapy. Nitsch et al. (2000) reported that TRAIL induced apoptosis in the human brain, which argues against the use of TRAIL for therapy of human brain tumors. However, neuroinflammatory T cells that express TRAIL might induce apoptosis of brain tissue, indicating a potential target for treatment of multiple sclerosis. Animal model experiments lend further support to the function of TNFSF10. Cretney et al. (2002) generated healthy, fertile Trail-deficient mice by homologous recombination. Functional analysis confirmed the importance of Trail in mediating natural killer (NK) cytotoxicity to some tumor target cells. The authors found that Trail contributes to NK cell suppression of metastases to liver by a renal adenocarcinoma and to multiple tissues by breast carcinoma cells. Trail  $-/-$  mice were also more susceptible than wildtype mice to early onset of fibrosarcomas from lower doses of methylcholanthrene.

[26610] It is appreciated that the abovementioned animal model for TNFSF10 is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[26611] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26612] Degli-Esposti, M. A.; Dougall, W. C.; Smolak, P. J.; Waugh, J. Y.; Smith, C. A.; Goodwin, R. G. : The novel receptor TRAIL-R4 induces NF-kappa-B and protects against TRAIL-mediated apoptosis, yet retains an incomplete death domain. *Immunity* 7: 813-820, 1997. ; and

[26613] Nitsch, R.; Bechmann, I.; Deisz, R. A.; Haas, D.; Lehmann, T. N.; Wendling, U.; Zipp, F. : Human brain-cell death induced by tumour-necrosis-factor-related apoptosis-inducing ligand (TRA.

[26614] Further studies establishing the function and utilities of TNFSF10 are found in John Hopkins OMIM database record ID 603598, and in sited publications numbered 5312-5313, 5880, 5963-5965, 60 and 5966 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0323 (Accession XM\_032634) is another VGAM637 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31687, to the nucleotide sequence of VGAM637 RNA, herein designated VGAM RNA, also designated SEQ ID:3348.

[26615] Another function of VGAM637 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. LOC254251 (Accession XM\_171088) is another VGAM637 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45893, to the nucleotide sequence of VGAM637 RNA, herein designated VGAM RNA, also designated SEQ ID:3348.

[26616] Another function of VGAM637 is therefore inhibition of LOC254251 (Accession XM\_171088). Accordingly, utilities

of VGAM637 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 638 (VGAM638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26617] VGAM638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM638 was detected is described hereinabove with reference to Figs. 1–8.

[26618] VGAM638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip Mosaic Virus. VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26619] VGAM638 gene encodes a VGAM638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM638 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM638 precursor RNA is designated SEQ ID:624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:624 is located at position 6990 relative to the genome of Turnip Mosaic Virus.

[26620] VGAM638 precursor RNA folds onto itself, forming VGAM638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26621] An enzyme complex designated DICER COMPLEX, `dices` the VGAM638 folded precursor RNA into VGAM638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM638 RNA is designated SEQ ID:3349, and

is provided hereinbelow with reference to the sequence listing part.

[26622] VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM638 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26623] VGAM638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM638 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26624] The complementary binding of VGAM638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM638 host target RNA into VGAM638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26625] It is appreciated that VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM638 host target genes. The mRNA of each one of this plurality of VGAM638 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM638 RNA, herein designated VGAM RNA, and which when bound by VGAM638 RNA causes inhibition of translation of respective one or more VGAM638 host target proteins.

[26626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM638 gene, herein designated VGAM GENE, on one or more VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26627] It is yet further appreciated that a function of VGAM638 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of viral infection by Turnip Mosaic Virus. Specific functions, and accordingly utilities, of VGAM638 correlate with, and may be deduced from, the identity of the host target genes which VGAM638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26628] Nucleotide sequences of the VGAM638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM638 are further described hereinbelow with reference to Table 1.

[26629] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM638 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26630] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM638 gene, herein designated VGAM is inhibition of expression of VGAM638 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM638 correlate with, and may be deduced from, the identity of the target genes which VGAM638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26631] V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163) is a VGAM638 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11650, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26632] A function of VGAM638 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM188. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174) is another VGAM638 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6841, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26633] Another function of VGAM638 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM55. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM\_003458) is another VGAM638 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:9521, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26634] Another function of VGAM638 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM\_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN has been established by previous studies. Both the presynaptic terminal and the postsynaptic compartment of neuronal synapses comprise a highly specialized cytoskeleton underlying the synaptic membranes. The presynaptic nerve terminal is the principal site of regulated neurotransmitter release.

The active zone is the region of the presynaptic plasmalemma over which synaptic vesicles dock, fuse, and release neurotransmitter. Piccolo (PCLO; 604918), a 420-kD protein, is 1 component of the presynaptic cytomatrix.

Tom Dieck et al. (1998) isolated a large (greater than 400 kD) protein in mouse that is also found in the presynaptic compartments of rat brain synapses. They designated the protein Bassoon because it, along with Piccolo, is part of the ensemble of presynaptic proteins that are involved in orchestrating events at the nerve terminal. Bassoon is found in axon terminals of hippocampal neurons where it is highly concentrated in the vicinity of the active zone.

Piccolo has a similar distribution and colocalizes with Bassoon in cultured hippocampal cells. Tom Dieck et al.

(1998) suggested that Bassoon may be involved in cytomatrix organization at the site of neurotransmitter re-

lease Multiple system atrophy (MSA) is a sporadic progressive neurodegenerative disease. By differential hybridization to high-density cDNA filters, Hashida et al.

(1998) identified human frontal lobe cDNAs with altered expression patterns in MSA patients. One partial cDNA whose expression was elevated 2-fold in MSA cerebella encoded a protein that the authors designated ZNF231

(zinc finger protein-231). By screening additional libraries with the partial cDNA, they assembled a full-length ZNF231 cDNA. The predicted 3,926-amino acid protein contains 2 glycine-proline dipeptide repeats, a pair of homologous C8 double zinc finger motifs, a leucine zipper motif, an SH3 domain-binding motif, 2 nuclear targeting sequences, 2 glutamine-rich domains, and a histidine-rich domain. Northern blot analysis of rat tissues indicated that the ZNF231 gene was expressed as a 16-kb mRNA specifically in brain. By RT-PCR of human brain cell lines and tissue, Hashida et al. (1998) determined that ZNF231 was expressed in the cerebellum and in a neuroblastoma cell line, but not in the white matter. Ishikawa et al. (1997) recovered a ZNF231 cDNA, designated KIAA0434, as 1 of 78 brain cDNAs that may encode large proteins. Gundelfinger (1999) stated that ZNF231 is the human homolog of Bassoon

[26635] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26638] Further studies establishing the function and utilities of BSN are found in John Hopkins OMIM database record ID 604020, and in cited publications numbered 7612–7613, 110 and 7632–7633 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deiodinase, Iodothyronine, Type III (DIO3, Accession NM\_001362) is another VGAM638 host target gene. DIO3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO3 BINDING SITE, designated SEQ ID:7042, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26639] Another function of VGAM638 is therefore inhibition of Deiodinase, Iodothyronine, Type III (DIO3, Accession NM\_001362), a gene which regulates circulating fetal thyroid hormone concentrations . Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO3. The function of DIO3 has been established by previous studies. Thyroid hormone is critical to the normal development of the human central nervous system. Salvatore et al. (1995) noted that, despite the presence of thyroxine (T4) and thyroid follicles in the fetal thyroid by 10 to 12 weeks of gestation, as well as the potential availability of maternal thyroid hormone, the free concentration of the active thyroid hormone T3 is less than half that of maternal levels up to the time of delivery. The physiologic rationale for this circumstance is not well understood, but the authors suggested that it is possible that 'normal' circulating T3 concentrations could have deleterious effects on immature tissues or could enhance the metabolic requirements of the fetus. There are 2 principal mechanisms by which the circulating fetal T3 concentration is maintained at low levels. One is that the type I iodothyronine deiodinase (OMIM Ref. No. 147892) in fetal liver is expressed at

lower levels relative to those in adult life. This reduces the extra thyroidal T3 supply from this source. The second important factor in maintaining low serum T3 concentrations is the expression of high levels of the type III deiodinase in placenta of all species examined. Type III iodothyronine deiodinase catalyzes the conversion of T4 and T3 to inactive metabolites. Salvatore et al. (1995) cloned human placental type III iodothyronine deiodinase (which they referred to as D3). It is a selenoenzyme, as evidenced by (1) the presence of an in-frame UGA codon at position 144; (2) the synthesis of a 32-kD (75)Se-labeled protein in D3 cDNA transfected cells; and (3) the presence of a selenocysteine insertion sequence element in the 3-prime untranslated region of an mRNA that is required for its expression. The authors stated that the D3 selenocysteine insertion sequence element is more potent than that found in the type I deiodinase or glutathione peroxidase (OMIM Ref. No. 138320) gene, suggesting a high priority for selenocysteine incorporation into this enzyme. The conservation of this enzyme from *Xenopus laevis* tadpoles to humans implies an essential role for regulation of thyroid hormone inactivation during embryologic development. Huang et al. (2000) reported the case of a

3-month-old infant with massive hepatic hemangiomas and primary hypothyroidism who needed very high doses of thyroid hormone to restore euthyroidism and normal thyrotropin secretion. This finding suggested that the rate of degradation of thyroid hormone was accelerated. They subsequently identified high levels of type III iodothyronine deiodinase activity in the hemangioma tissue. Normally present in the brain and placenta, this selenoenzyme catalyzes the conversion of thyroxine to reverse triiodothyronine and the conversion of triiodothyronine to 3,3-prime-diiodothyronine, both of which are biologically inactive. They then retrospectively analyzed other patients with hemangiomas and identified additional patients with similar histories and other hemangiomas with type III iodothyronine deiodinase activity.

[26640] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26641] Hernandez, A.; Park, J. P.; Lyon, G. J.; Mohandas, T. K.; St. Germain, D. L. : Localization of the type 3 iodothyronine deiodinase (DIO3) gene to human chromosome 14q32 and mouse chromosome 12F1. *Genomics* 53: 119–121, 1998.  
; and

[26642] Huang, S. A.; Tu, H. M.; Harney, J. W.; Venihaki, M.; Butte, A. J.; Kozakewich, H. P. W.; Fishman, S. J.; Larsen, P. R. : Severe hypothyroidism caused by type 3 iodothyronine deiodinase.

[26643] Further studies establishing the function and utilities of DIO3 are found in John Hopkins OMIM database record ID 601038, and in cited publications numbered 6871–6873 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ferritin, Heavy Polypeptide 1 (FTH1, Accession XM\_042852) is another VGAM638 host target gene. FTH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FTH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTH1 BINDING SITE, designated SEQ ID:33808, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26644] Another function of VGAM638 is therefore inhibition of Ferritin, Heavy Polypeptide 1 (FTH1, Accession XM\_042852), a gene which stores iron in a soluble, non-toxic, readily available form. Accordingly, utilities of

VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTH1. The function of FTH1 has been established by previous studies. Synthesis of both the H- and L-ferritin subunits is controlled by a common cytosolic protein, iron regulatory protein (IRP), which binds to the iron-responsive element (IRE) in the 5-prime untranslated region of the H- and L-ferritin mRNAs (Leibold and Munro, 1988; Eisenstein, 2000). In 4 of 7 members of a Japanese family affected by dominantly inherited iron overload, Kato et al. (2001) found a single point mutation (A49U; 134770.0001) in the IRE motif of H ferritin mRNA. Gel-shift mobility assay and Scatchard-plot analysis revealed that a mutated IRE probe had a higher binding affinity to IRP than did the wildtype probe. When mutated H subunit was overexpressed in COS1 cells, suppression of H-subunit synthesis and of the increment of radiolabeled iron uptake were observed. These data suggested that the A49U mutation in the IRE of H-subunit is responsible for tissue iron deposition and is a novel cause of hereditary iron overload, most likely related to impairment of the ferroxidase activity generated by H subunit. Animal model experiments lend further support to the function of FTH1. Ferreira et al. (2000) dis-

rupted the H ferritin gene in mice by homologous recombination. Heterozygous mice were healthy, fertile, and did not differ significantly from their control littermates.

However, Fth  $-/-$  embryos died between 3.5 and 9.5 days of development, suggesting that there is no functional redundancy between the 2 ferritin subunits and that, in the absence of H subunits, L ferritin homopolymers are not able to maintain iron in a bioavailable and nontoxic form. The pattern of expression of the wildtype Fth gene in 9.5-day embryos is restricted to the developing heart and central nervous system.

[26645] It is appreciated that the abovementioned animal model for FTH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[26646] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26647] Ferreira, C.; Bucchini, D.; Martin, M.-E.; Levi, S.; Arosio, P.; Grandchamp, B.; Beaumont, C. : Early embryonic lethality of H ferritin gene deletion in mice. J. Biol. Chem. 275: 3021–3024, 2000. ; and

[26648] Kato, J.; Fujikawa, K.; Kanda, M.; Fukuda, N.; Sasaki, K.;

Takayama, T.; Kobune, M.; Takada, K.; Takimoto, R.; Hamada, H.; Ikeda, T.; Niitsu, Y. : A mutation, in the iron-responsive el.

[26649] Further studies establishing the function and utilities of FTH1 are found in John Hopkins OMIM database record ID 134770, and in cited publications numbered 11578–11580, 3984, 11581–1159 and 11962–11970 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gonadotropin-releasing Hormone Receptor (GNRHR, Accession NM\_000406) is another VGAM638 host target gene. GNRHR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNRHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNRHR BINDING SITE, designated SEQ ID:5983, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26650] Another function of VGAM638 is therefore inhibition of Gonadotropin-releasing Hormone Receptor (GNRHR, Accession NM\_000406), a gene which stimulates the secre-

tion stimulates phosphoinositide turnover and membrane depolarization. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNRHR. The function of GNRHR has been established by previous studies. Kakar et al. (1992) isolated a cDNA for the GNRH receptor and showed that it encodes a protein with a transmembrane topology similar to that of other G protein-coupled 7-transmembrane-domain receptors. Grosse et al. (1997) used RT-PCR of human pituitary poly(A)<sup>+</sup> RNA to clone the full-length GNRHR gene and a second truncated cDNA characterized by a 128-bp deletion between nucleotide positions 522 and 651. The deletion causes a frameshift in the open reading frame, thus generating new coding sequence for a further 75 amino acids. The truncated cDNA arises from alternative splicing that uses a cryptic 3-prime splice site in exon 2. Translation products of approximately 45 to 50 and 42 kD were immunoprecipitated from COS-7 cells transfected with wildtype and truncated GNRHR cDNAs, respectively. The splice variant was incapable of ligand binding and signal transduction. Coexpression of wildtype and truncated proteins in transiently or stably transfected cells, resulted in impaired signaling

via the wildtype GNRHR by reducing maximal agonist-induced inositol phosphate accumulation. This inhibitory effect depended on the amount of splice variant cDNA co-transfected and was specific for GNRHR. Coexpression of the wildtype and truncated GNRHRs resulted in impaired insertion of wildtype GNRHR into the plasma membrane. Caron et al. (1999) studied a kindred with 3 sibs with isolated hypogonadotropic hypogonadism who were genetic compounds for the arg262-to-gln mutation (138850.0002) and an ala129-to-asp (138850.0004) mutation that resulted in a complete loss of function. The 2 brothers had microphallus and bilateral cryptorchidism and were referred for lack of puberty; their sister had primary amenorrhea and a complete lack of puberty. The authors concluded that these hypogonadal patients were partially resistant to pulsatile GNRH administration, suggesting that they should be treated with gonadotropins to induce spermatogenesis or ovulation rather than with pulsatile GNRH. Kottler et al. (1999) analyzed in detail the GNRHR mutations in 7 independent familial and sporadic cases of idiopathic hypogonadotropic hypogonadism reported to that time. The Q106R (138850.0001) and R262Q (138850.0002) mutations were frequent in pa-

tients from all geographic areas (North or South America or Europe).

[26651] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26652] Caron, P.; Chauvin, S.; Christin-Maitre, S.; Bennet, A.; Lahlou, N.; Counis, R.; Bouchard, P.; Kottler, M.-L. : Resistance of hypogonadic patients with mutated GnRH receptor genes to pulsatile GnRH administration. J. Clin. Endocr. Metab. 84: 990-996, 1999. ; and

[26653] Kakar, S. S.; Musgrove, L. C.; Devor, D. C.; Sellers, J. C.; Neill, J. D. : Cloning, sequencing, and expression of human gonadotropin releasing hormone (GnRH) receptor. Biochem. Biophys.

[26654] Further studies establishing the function and utilities of GNRHR are found in John Hopkins OMIM database record ID 138850, and in cited publications numbered 3917-392 and 4008-4022 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505) is another VGAM638 host target gene. GPR30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR30,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR30 BINDING SITE, designated SEQ ID:7252, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26655] Another function of VGAM638 is therefore inhibition of G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505), a gene which receives chemical signals in cell communication in both CNS and peripheral tissues. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR30. The function of GPR30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM\_034274) is another VGAM638 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MYBL1 BINDING SITE, designated SEQ ID:32041, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26656] Another function of VGAM638 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM\_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1. The function of MYBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM184. Neurocalcin Delta (NCALD, Accession NM\_032041) is another VGAM638 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25746, to the nucleotide sequence of VGAM638

RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26657] Another function of VGAM638 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM\_032041). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Short Stature Homeobox (SHOX, Accession NM\_006883) is another VGAM638 host target gene. SHOX BINDING SITE1 and SHOX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SHOX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE1 and SHOX BINDING SITE2, designated SEQ ID:13746 and SEQ ID:6053 respectively, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26658] Another function of VGAM638 is therefore inhibition of Short Stature Homeobox (SHOX, Accession NM\_006883). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX. Thymidine Kinase 2, Mitochondrial

(TK2, Accession NM\_004614) is another VGAM638 host target gene. TK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK2 BINDING SITE, designated SEQ ID:10959, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26659] Another function of VGAM638 is therefore inhibition of Thymidine Kinase 2, Mitochondrial (TK2, Accession NM\_004614), a gene which phosphorylates thymidine, deoxycytidine, deoxyuridine, and also anti-viral and anti-cancer nucleoside analogs. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK2. The function of TK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.BM-002 (Accession NM\_016617) is another VGAM638 host target gene. BM-002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by BM-002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM-002 BINDING SITE, designated SEQ ID:18725, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26660] Another function of VGAM638 is therefore inhibition of BM-002 (Accession NM\_016617). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002. C1q and Tumor Necrosis Factor Related Protein 3 (C1QTNF3, Accession NM\_030945) is another VGAM638 host target gene. C1QTNF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF3 BINDING SITE, designated SEQ ID:25217, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26661] Another function of VGAM638 is therefore inhibition of

C1q and Tumor Necrosis Factor Related Protein 3 (C1QTNF3, Accession NM\_030945). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF3. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM\_005769) is another VGAM638 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12339, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26662] Another function of VGAM638 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM\_005769). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. DKFZp761N1114 (Accession XM\_086327) is another VGAM638 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38605, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26663] Another function of VGAM638 is therefore inhibition of DKFZp761N1114 (Accession XM\_086327). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114. FLJ14327 (Accession NM\_024912) is another VGAM638 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24427, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26664] Another function of VGAM638 is therefore inhibition of

FLJ14327 (Accession NM\_024912). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ23375 (Accession NM\_024956) is another VGAM638 host target gene. FLJ23375 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23375 BINDING SITE, designated SEQ ID:24513, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26665] Another function of VGAM638 is therefore inhibition of FLJ23375 (Accession NM\_024956). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23375. GTP Binding Protein 2 (GTPBP2, Accession NM\_019096) is another VGAM638 host target gene. GTPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GTPBP2 BINDING SITE, designated SEQ ID:21171, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26666] Another function of VGAM638 is therefore inhibition of GTP Binding Protein 2 (GTPBP2, Accession NM\_019096). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP2. KIAA0876 (Accession XM\_035625) is another VGAM638 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32295, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26667] Another function of VGAM638 is therefore inhibition of KIAA0876 (Accession XM\_035625). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0876. KIAA0923 (Accession NM\_014021) is another VGAM638 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15239, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26668] Another function of VGAM638 is therefore inhibition of KIAA0923 (Accession NM\_014021). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. Kelch-like 6 (Drosophila) (KLHL6, Accession NM\_130446) is another VGAM638 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KLHL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28211, to the nucleotide sequence of VGAM638 RNA,

herein designated VGAM RNA, also designated SEQ ID:3349.

[26669] Another function of VGAM638 is therefore inhibition of Kelch-like 6 (*Drosophila*) (KLHL6, Accession NM\_130446). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. MDN1, Midasin Homolog (yeast) (MDN1, Accession XM\_031539) is another VGAM638 host target gene. MDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDN1 BINDING SITE, designated SEQ ID:31409, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26670] Another function of VGAM638 is therefore inhibition of MDN1, Midasin Homolog (yeast) (MDN1, Accession XM\_031539). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDN1. MGC10870 (Accession NM\_032301) is another VGAM638 host target

gene. MGC10870 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10870 BINDING SITE, designated SEQ ID:26080, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26671] Another function of VGAM638 is therefore inhibition of MGC10870 (Accession NM\_032301). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10870. MGC10981 (Accession NM\_032654) is another VGAM638 host target gene. MGC10981 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10981 BINDING SITE, designated SEQ ID:26387, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26672] Another function of VGAM638 is therefore inhibition of MGC10981 (Accession NM\_032654). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10981. RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860) is another VGAM638 host target gene. RABL4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RABL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABL4 BINDING SITE, designated SEQ ID:13730, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26673] Another function of VGAM638 is therefore inhibition of RAB, Member of RAS Oncogene Family-like 4 (RABL4, Accession NM\_006860). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABL4. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM\_006065) is another VGAM638 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12705, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26674] Another function of VGAM638 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM\_006065). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM\_080872) is another VGAM638 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:28110, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26675] Another function of VGAM638 is therefore inhibition of

Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM\_080872). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC150225 (Accession XM\_097870) is another VGAM638 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41189, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26676] Another function of VGAM638 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC154007 (Accession XM\_087824) is another VGAM638 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39456, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26677] Another function of VGAM638 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. LOC154222 (Accession XM\_098497) is another VGAM638 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41692, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26678] Another function of VGAM638 is therefore inhibition of LOC154222 (Accession XM\_098497). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC154222. LOC157918 (Accession XM\_098842) is another VGAM638 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41894, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26679] Another function of VGAM638 is therefore inhibition of LOC157918 (Accession XM\_098842). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC157919 (Accession XM\_088420) is another VGAM638 host target gene. LOC157919 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157919 BINDING SITE, designated SEQ ID:39681, to the nucleotide sequence of VGAM638 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3349.

[26680] Another function of VGAM638 is therefore inhibition of LOC157919 (Accession XM\_088420). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157919. LOC201562 (Accession XM\_114343) is another VGAM638 host target gene. LOC201562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201562 BINDING SITE, designated SEQ ID:42884, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26681] Another function of VGAM638 is therefore inhibition of LOC201562 (Accession XM\_114343). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201562. LOC257106 (Accession XM\_170910) is another VGAM638 host target gene. LOC257106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257106, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257106 BINDING SITE, designated SEQ ID:45676, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26682] Another function of VGAM638 is therefore inhibition of LOC257106 (Accession XM\_170910). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257106. LOC92689 (Accession XM\_046663) is another VGAM638 host target gene. LOC92689 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92689 BINDING SITE, designated SEQ ID:34783, to the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, also designated SEQ ID:3349.

[26683] Another function of VGAM638 is therefore inhibition of LOC92689 (Accession XM\_046663). Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92689. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 639 (VGAM639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26684] VGAM639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM639 was detected is described hereinabove with reference to Figs. 1–8.

[26685] VGAM639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip Mosaic Virus. VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26686] VGAM639 gene encodes a VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM639 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM639 precursor RNA is designated SEQ

ID:625, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:625 is located at position 5030 relative to the genome of Turnip Mosaic Virus.

[26687] VGAM639 precursor RNA folds onto itself, forming VGAM639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26688] An enzyme complex designated DICER COMPLEX, `dices` the VGAM639 folded precursor RNA into VGAM639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM639 RNA is designated SEQ ID:3350, and is provided hereinbelow with reference to the sequence

listing part.

[26689] VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM639 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26690] VGAM639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM639 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM639 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26691] The complementary binding of VGAM639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM639 host target RNA into VGAM639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26692] It is appreciated that VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM639 host target genes. The mRNA of each one of this plurality of VGAM639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM639 RNA, herein designated VGAM

RNA, and which when bound by VGAM639 RNA causes inhibition of translation of respective one or more VGAM639 host target proteins.

[26693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM639 gene, herein designated VGAM GENE, on one or more VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26694] It is yet further appreciated that a function of VGAM639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM639 include diagnosis, prevention and treatment of viral infection by Turnip Mosaic Virus. Specific functions, and accordingly utilities, of VGAM639 correlate with, and may be deduced from, the identity of the host target genes which VGAM639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26695] Nucleotide sequences of the VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM639 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM639 are further described hereinbelow with reference to Table 1.

[26696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM639 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26697] As mentioned hereinabove with reference to Fig. 1, a function of VGAM639 gene, herein designated VGAM is

inhibition of expression of VGAM639 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM639 correlate with, and may be deduced from, the identity of the target genes which VGAM639 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26698] GLI-Kruppel Family Member GLI2 (GLI2, Accession NM\_030379) is a VGAM639 host target gene. GLI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GLI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLI2 BINDING SITE, designated SEQ ID:24938, to the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26699] A function of VGAM639 is therefore inhibition of GLI-Kruppel Family Member GLI2 (GLI2, Accession NM\_030379), a gene which may promote tax-dependent transcription of T-cell leukemia virus type 1 genes. Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLI2. The function of GLI2 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM465. Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM\_018312) is another VGAM639 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20303, to the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26700] Another function of VGAM639 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM\_018312). Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. ECE2 (Accession NM\_014693) is another VGAM639 host target gene. ECE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ECE2, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECE2 BINDING SITE, designated SEQ ID:16198, to the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26701] Another function of VGAM639 is therefore inhibition of ECE2 (Accession NM\_014693). Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECE2. FLJ10901 (Accession NM\_018265) is another VGAM639 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20230, to the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26702] Another function of VGAM639 is therefore inhibition of FLJ10901 (Accession NM\_018265). Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901.

Zinc Finger Protein 317 (ZNF317, Accession XM\_050435) is another VGAM639 host target gene. ZNF317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF317 BINDING SITE, designated SEQ ID:35636, to the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26703] Another function of VGAM639 is therefore inhibition of Zinc Finger Protein 317 (ZNF317, Accession XM\_050435). Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF317. LOC245771 (Accession XM\_167366) is another VGAM639 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44635, to the nucleotide sequence of

VGAM639 RNA, herein designated VGAM RNA, also designated SEQ ID:3350.

[26704] Another function of VGAM639 is therefore inhibition of LOC245771 (Accession XM\_167366). Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 640 (VGAM640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26705] VGAM640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM640 was detected is described hereinabove with reference to Figs. 1–8.

[26706] VGAM640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip Mosaic Virus. VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26707] VGAM640 gene encodes a VGAM640 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM640 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM640 precursor RNA is designated SEQ ID:626, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:626 is located at position 9395 relative to the genome of Turnip Mosaic Virus.

[26708] VGAM640 precursor RNA folds onto itself, forming VGAM640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26709] An enzyme complex designated DICER COMPLEX, `dices` the VGAM640 folded precursor RNA into VGAM640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM640 RNA is designated SEQ ID:3351, and is provided hereinbelow with reference to the sequence listing part.

[26710] VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM640 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[26711] VGAM640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM640 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26712] The complementary binding of VGAM640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM640 host target RNA into VGAM640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26713] It is appreciated that VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM640 host target genes. The mRNA of each one of this plurality of VGAM640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM640 RNA, herein designated VGAM RNA, and which when bound by VGAM640 RNA causes inhibition of translation of respective one or more VGAM640 host target proteins.

[26714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM640 gene, herein designated VGAM GENE, on one or more VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[26715] It is yet further appreciated that a function of VGAM640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of viral infection by Turnip Mosaic Virus. Specific functions, and accordingly utilities, of VGAM640 correlate with, and may be deduced from, the identity of the host target genes which VGAM640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26716] Nucleotide sequences of the VGAM640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM640 are further described hereinbelow with reference to Table 1.

[26717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM640 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26718] As mentioned hereinabove with reference to Fig. 1, a function of VGAM640 gene, herein designated VGAM is inhibition of expression of VGAM640 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM640 correlate with, and may be deduced from, the identity of the target genes which VGAM640 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26719] G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM\_139209) is a VGAM640 host target gene. GPRK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:29228, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26720] A function of VGAM640 is therefore inhibition of G Protein-coupled Receptor Kinase 7 (GPRK7, Accession

NM\_139209), a gene which may play a role in signal transduction pathways that involve calcium as a second messenger. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 has been established by previous studies. Weiss et al. (2001) cloned GRK7 from a human retina cDNA library using primers designed from the pig GRK7 sequence. GRK7 encodes a deduced 553-amino acid protein with a calculated molecular mass of 62 kD. The protein contains a CaaX motif for isoprenylation and carboxymethylation of the C terminus, an autophosphorylation site at ser491, and a motif for geranylgeranylation. GRK7 shares 85% and 59% amino acid identity with the pig and medaka fish GRK7, respectively, and 47% identity with GRK1 (OMIM Ref. No. 180381). Western blot analysis revealed an apparent molecular mass of 62 kD for purified recombinant human GRK7, and an identical mass in retinal extracts of various mammalian species. Immunolocalization using human retina sections showed staining limited to cone cells, with particularly intense staining in the outer segments. Weiss et al. (2001) noted that GRK1 is expressed in both cones and rods. By database analysis, Chen et al.

(2001) independently identified GRK7 and cloned GRK7 from a human retinal cDNA library and from human retinal mRNA by PCR and RT-PCR. RT-PCR revealed retina-specific expression in human tissues. Western blot analysis detected a 64-kD band in human retina, but not in any of the other 11 tissues tested. Immunocytochemistry showed positive staining for GRK7 in the nuclear layers, the inner and outer plexiform layers, and the inner segment layer. GRK7 colocalized with GRK1 in human cone outer segments. In retina from a 4-month-old donor, GRK7 was specifically localized to the proximal portion of the cone outer segments. Western blot analysis of mouse tissues showed more widespread expression, including not only retina but brain, olfactory bulb, lung, and pancreas. In the mouse retina, staining was seen in the inner and outer plexiform layers and in the nucleus of the inner nuclear and ganglion cell layers. Outer segment layers were negative for Grk7.

[26721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26722] Chen, C.-K.; Zhang, K.; Church-Kopish, J.; Huang, W.; Zhang, H.; Chen, Y.-J.; Frederick, J. M.; Baehr, W. : Charac-

terization of human GRK7 as a potential cone opsin kinase. *Molec. Vision* 7: 305–313, 2001. ; and

[26723] Weiss, E. R.; Ducceschi, M. H.; Horner, T. J.; Li, A.; Craft, C. M.; Osawa, S. : Species-specific differences in expression of G-protein-coupled receptor kinase (GRK) 7 and GRK1 in mam.

[26724] Further studies establishing the function and utilities of GPRK7 are found in John Hopkins OMIM database record ID 606987, and in cited publications numbered 5529–5530 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM\_002209) is another VGAM640 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7971, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26725] Another function of VGAM640 is therefore inhibition of

Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM\_002209), a gene which is a receptor for icam1, icam2, icam3 and icam4. It is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM200.

Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM\_000212) is another VGAM640 host target gene. ITGB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB3 BINDING SITE, designated SEQ ID:5707, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26726] Another function of VGAM640 is therefore inhibition of Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM\_000212). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB3. V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM\_005376) is another VGAM640 host target gene. MYCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL1 BINDING SITE, designated SEQ ID:11853, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26727] Another function of VGAM640 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM\_005376), a gene which is a Myc-like transcription factor. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with MYCL1. The function of MYCL1 has been established by previous studies. Nau et al. (1985) cloned from DNA of small-cell lung cancer (SCCL) a gene with homology to a small region of both MYC (OMIM Ref. No. 190080) and NMYC (OMIM Ref. No. 164840). By somatic cell hybridization and in situ hybridization, they assigned the gene to 1p32. This LMYC sequence was amplified 10- to 20-fold in the DNA of 4 SCCL lines and of 1 SCCL specimen taken directly from a patient. A restriction polymorphism was found. In heterozygotes, only 1 of the 2 alleles was amplified in any 1 genome. In a linkage map of chromosome 1 prepared by Rouleau et al. (1990), it was concluded that MYCL1 is 17 cM proximal to RH. Kaye et al. (1988) found that the LMYC gene is composed of 3 exons and 2 introns spanning 6.6 kilobases. Several distinct mRNAs were produced in all SCCL cell lines that expressed LMYC. These transcripts were generated from a single gene by alternative splicing of introns 1 and 2 and by use of alternative polyadenylation signals. Comparisons with MYC and NMYC demonstrated multiple discrete regions with extensive homology. Kawashima et al. (1988) concluded that a correlation exists between particular RFLP alleles of the MYCL gene and the occurrence of

metastasis of lung cancer to lymph nodes and other organs. Among lung cancer patients, those with only the L band (10 kb) had few lymph node metastases, whereas patients with either the S band (6 kb) or the S and L bands almost always had lymph node metastases. A similar correlation was found between the presence of the S band and metastases to other organs. The correlation was particularly marked in cases of adenocarcinoma of the lung. By study of DNA from mouse–hamster somatic cell hybrids, Campbell et al. (1989) mapped 2 L–myc loci provisionally to mouse chromosomes 4 and 12. The locus on chromosome 12 may be a pseudogene. When studying chromosome 1p breakpoints in neuroblastoma cell lines using fluorescence in situ hybridization (FISH) with region–specific probes, Van Roy et al. (1995) found evidence for a position of MYCL1 more distal than 1p32. To investigate the discrepancy Speleman et al. (1996) used FISH on high–resolution R–banded chromosomes with a YAC clone for MYCL1 and reassigned the gene to 1p34.3.

[26728] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26729] Kawashima, K.; Shikama, H.; Imoto, K.; Izawa, M.; Naruke,

T.; Okabayashi, K.; Nishimura, S. : Close correlation between restriction fragment length polymorphism of the L-MYC gene and metastasis of human lung cancer to the lymph nodes and other organs. Proc. Nat. Acad. Sci. 85: 2353–2356, 1988. ; and

[26730] Kaye, F.; Battey, J.; Nau, M.; Brooks, B.; Seifter, E.; De Greve, J.; Birrer, M.; Sausville, E.; Minna, J. : Structure and expression of the human L-myc gene reveal a complex pattern of.

[26731] Further studies establishing the function and utilities of MYCL1 are found in John Hopkins OMIM database record ID 164850, and in cited publications numbered 173 and 1818–1824 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sirtuin Silent Mating Type Information Regulation 2 Homolog 2 (*S. cerevisiae*) (SIRT2, Accession NM\_030593) is another VGAM640 host target gene. SIRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT2 BINDING SITE, designated SEQ ID:24958, to the nucleotide sequence of

VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26732] Another function of VGAM640 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 2 (*S. cerevisiae*) (SIRT2, Accession NM\_030593), a gene which might function in telomeric silencing, cell cycle progression and chromosome stability. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT2. The function of SIRT2 has been established by previous studies. The yeast Sir2 protein (Shore et al., 1984) regulates epigenetic gene silencing and, as a possible antiaging effect, suppresses recombination of rDNA. Studies involving cobB, a bacterial Sir2-like gene, have suggested that Sir2 may encode a pyridine nucleotide transferase. By in silico and PCR-cloning techniques, Frye (1999) obtained cDNA sequences encoding 5 human Sir2-like genes, which they called sirtuin-1 to -5 (SIRT1 to SIRT5). The SIRT1 (OMIM Ref. No. 604479) sequence has the closest homology to the *S. cerevisiae* Sir2 protein, while SIRT4 (OMIM Ref. No. 604482) and SIRT5 (OMIM Ref. No. 604483) more closely resemble prokaryotic sirtuin sequences. PCR analysis showed that the 5 human sirtuins

are widely expressed in fetal and adult tissues. Recombinant human SIRT2 was able to cause radioactivity to be transferred from (32P)NAD to bovine serum albumin (BSA). When a conserved histidine within SIRT2 was converted to tyrosine, the mutant recombinant protein was unable to transfer radioactivity from (32P)NAD to BSA. These results suggested that the sirtuins may function via mono-ADP-ribosylation of proteins. Tanny et al. (1999) showed that the yeast Sir2 protein can transfer labeled phosphate from nicotinamide adenine dinucleotide to itself and histones in vitro. A modified form of Sir2, which results from its automodification activity, was specifically recognized by anti-mono-ADP-ribose antibodies, suggesting that Sir2 is an ADP-ribosyltransferase. Mutation of a phylogenetically invariant histidine (his364 to tyr) in Sir2 abolished both its enzymatic activity in vitro and its silencing functions in vivo. However, the mutant protein was associated with chromatin and other silencing factors in a manner similar to wildtype Sir2. These findings suggested that Sir2 contains an ADP-ribosyltransferase activity that is essential for its silencing function.

[26733] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [26734] Frye, R. A. : Characterization of five human cDNAs with homology to the yeast SIR2 gene: Sir2-like proteins (sirtuins) metabolize NAD and may have protein ADP-ribosyltransferase activity. *Biochem. Biophys. Res. Commun.* 260: 273–279, 1999. ; and
- [26735] Tanny, J. C.; Dowd, G. J.; Huang, J.; Hilz, H.; Moazed, D. : An enzymatic activity in the yeast Sir2 protein that is essential for gene silencing. *Cell* 99: 735–745, 1999.
- [26736] Further studies establishing the function and utilities of SIRT2 are found in John Hopkins OMIM database record ID 604480, and in cited publications numbered 5008, 504 and 5051 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Protein D52-like 2 (TPD52L2, Accession NM\_003288) is another VGAM640 host target gene. TPD52L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPD52L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPD52L2 BINDING SITE, designated SEQ ID:9297, to the nucleotide sequence of VGAM640 RNA, herein designated

VGAM RNA, also designated SEQ ID:3351.

[26737] Another function of VGAM640 is therefore inhibition of Tumor Protein D52-like 2 (TPD52L2, Accession NM\_003288). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52L2. Zinc Finger Protein 261 (ZNF261, Accession NM\_005096) is another VGAM640 host target gene. ZNF261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF261 BINDING SITE, designated SEQ ID:11563, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26738] Another function of VGAM640 is therefore inhibition of Zinc Finger Protein 261 (ZNF261, Accession NM\_005096). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF261. Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261) is another VGAM640 host target gene. C20orf103 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE, designated SEQ ID:14570, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26739] Another function of VGAM640 is therefore inhibition of Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM\_012261). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103. MGC5242 (Accession NM\_024033) is another VGAM640 host target gene. MGC5242 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5242 BINDING SITE, designated SEQ ID:23464, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26740] Another function of VGAM640 is therefore inhibition of MGC5242 (Accession NM\_024033). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5242. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM\_012431) is another VGAM640 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:14809, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26741] Another function of VGAM640 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM\_012431). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC112817 (Accession NM\_138413) is another VGAM640 host target

gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28781, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26742] Another function of VGAM640 is therefore inhibition of LOC112817 (Accession NM\_138413). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC147353 (Accession XM\_097227) is another VGAM640 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40834, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26743] Another function of VGAM640 is therefore inhibition of LOC147353 (Accession XM\_097227). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC63923 (Accession XM\_040527) is another VGAM640 host target gene. LOC63923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC63923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63923 BINDING SITE, designated SEQ ID:33325, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26744] Another function of VGAM640 is therefore inhibition of LOC63923 (Accession XM\_040527). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63923. LOC91301 (Accession XM\_037564) is another VGAM640 host target gene. LOC91301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91301, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91301 BINDING SITE, designated SEQ ID:32647, to the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, also designated SEQ ID:3351.

[26745] Another function of VGAM640 is therefore inhibition of LOC91301 (Accession XM\_037564). Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 641 (VGAM641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26746] VGAM641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM641 was detected is described hereinabove with reference to Figs. 1–8.

[26747] VGAM641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM641 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[26748] VGAM641 gene encodes a VGAM641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM641 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM641 precursor RNA is designated SEQ ID:627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:627 is located at position 50326 relative to the genome of Rat Cytomegalovirus.

[26749] VGAM641 precursor RNA folds onto itself, forming VGAM641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26750] An enzyme complex designated DICER COMPLEX, `dices` the VGAM641 folded precursor RNA into VGAM641 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM641 RNA is designated SEQ ID:3352, and is provided hereinbelow with reference to the sequence listing part.

[26751] VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM641 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26752] VGAM641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM641 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM641 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26753] The complementary binding of VGAM641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM641 host target RNA into VGAM641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26754] It is appreciated that VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM641 host target genes. The mRNA of each one of this plurality of VGAM641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM641 RNA, herein designated VGAM RNA, and which when bound by VGAM641 RNA causes inhibition of translation of respective one or more VGAM641 host target proteins.

[26755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM641 gene, herein designated VGAM GENE, on one or more VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26756] It is yet further appreciated that a function of VGAM641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM641 correlate with, and may be deduced from, the identity of the host target genes which VGAM641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26757] Nucleotide sequences of the VGAM641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM641 are further described hereinbelow with reference to Table 1.

[26758] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM641 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26759] As mentioned hereinabove with reference to Fig. 1, a function of VGAM641 gene, herein designated VGAM is inhibition of expression of VGAM641 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM641 correlate with, and may be deduced from, the identity of the target genes which VGAM641 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26760] Polycystic Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071) is a VGAM641 host target gene. PKDREJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKDREJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKDREJ BINDING SITE, designated SEQ

ID:12714, to the nucleotide sequence of VGAM641 RNA, herein designated VGAM RNA, also designated SEQ ID:3352.

[26761] A function of VGAM641 is therefore inhibition of Polycystic Kidney Disease (polycystin) and REJ (sperm receptor for egg jelly homolog, sea urchin)-like (PKDREJ, Accession NM\_006071), a gene which may intervene in fertilization. Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKDREJ. The function of PKDREJ has been established by previous studies. By searching cDNA and genomic databases for sequences similar to PKD1 (OMIM Ref. No. 601313), PKD2 (OMIM Ref. No. 173910), and the sea urchin sperm receptor for egg jelly (suREJ), Hughes et al. (1999) identified an intronless gene, which they designated PKDREJ, on cosmids located on chromosome 22q13. By screening a testis cDNA library, the authors obtained a PKDREJ cDNA encoding a deduced 2,253-amino acid protein. The PKDREJ protein is 64% identical and 78% similar to the mouse Pkdrej protein. Hydrophobicity analysis indicated that the structure of PKDREJ, with 11 transmembrane regions, is similar to that of PKD1. Northern blot analysis showed expression of an approximately 8-kb

PKDREJ transcript exclusively in testis, coincident with the timing of sperm maturation. By radiation hybrid analysis, Veldhuisen et al. (1999) mapped the PKDREJ gene to chromosome 22q13.3.

[26762] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26763] Hughes, J.; Ward, C. J.; Aspinwall, R.; Butler, R.; Harris, P. C. : Identification of a human homologue of the sea urchin receptor for egg jelly: a polycystic kidney disease-like protein. Hum. Molec. Genet. 8: 543–549, 1999. ; and

[26764] Veldhuisen, B.; Spruit, L.; Dauwerse, H. G.; Breuning, M. H.; Peters, D. J. : Genes homologous to the autosomal dominant polycystic kidney disease genes (PKD1 and PKD2). Europ. J. Hum.

[26765] Further studies establishing the function and utilities of PKDREJ are found in John Hopkins OMIM database record ID 604670, and in cited publications numbered 7483 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chloride Intracellular Channel 5 (CLIC5, Accession NM\_016929) is another VGAM641 host target gene. CLIC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by CLIC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC5 BINDING SITE, designated SEQ ID:18847, to the nucleotide sequence of VGAM641 RNA, herein designated VGAM RNA, also designated SEQ ID:3352.

[26766] Another function of VGAM641 is therefore inhibition of Chloride Intracellular Channel 5 (CLIC5, Accession NM\_016929). Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC5. FLJ23360 (Accession NM\_023076) is another VGAM641 host target gene. FLJ23360 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:23334, to the nucleotide sequence of VGAM641 RNA, herein designated VGAM RNA, also designated SEQ ID:3352.

[26767] Another function of VGAM641 is therefore inhibition of

FLJ23360 (Accession NM\_023076). Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. RTP801 (Accession NM\_019058) is another VGAM641 host target gene. RTP801 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RTP801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTP801 BINDING SITE, designated SEQ ID:21141, to the nucleotide sequence of VGAM641 RNA, herein designated VGAM RNA, also designated SEQ ID:3352.

[26768] Another function of VGAM641 is therefore inhibition of RTP801 (Accession NM\_019058). Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTP801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 642 (VGAM642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26769] VGAM642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM642 was detected is described hereinabove with reference to Figs. 1–8.

[26770] VGAM642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26771] VGAM642 gene encodes a VGAM642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM642 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM642 precursor RNA is designated SEQ ID:628, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:628 is located at position 96235 relative to the genome of Rat Cytomegalovirus.

[26772] VGAM642 precursor RNA folds onto itself, forming VGAM642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26773] An enzyme complex designated DICER COMPLEX, `dices` the VGAM642 folded precursor RNA into VGAM642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM642 RNA is designated SEQ ID:3353, and is provided hereinbelow with reference to the sequence listing part.

[26774] VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM642 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[26775] VGAM642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM642 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26776] The complementary binding of VGAM642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM642 host target RNA into VGAM642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26777] It is appreciated that VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM642 host target genes. The mRNA of each one of this plurality of VGAM642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM642 RNA, herein designated VGAM RNA, and which when bound by VGAM642 RNA causes inhibition of translation of respective one or more VGAM642 host target proteins.

[26778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM642 gene, herein designated VGAM GENE, on one or more VGAM642 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26779] It is yet further appreciated that a function of VGAM642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM642 correlate with, and may be deduced from, the identity of the host target genes which VGAM642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26780] Nucleotide sequences of the VGAM642 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM642 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM642 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM642 are further  
described hereinbelow with reference to Table 1.

[26781] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM642 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM642 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[26782] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM642 gene, herein designated VGAM is  
inhibition of expression of VGAM642 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM642 correlate with, and may be deduced  
from, the identity of the target genes which VGAM642  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[26783] ATPase, Cu++ Transporting, Beta Polypeptide (Wilson dis-  
ease) (ATP7B, Accession NM\_000053) is a VGAM642 host

target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5502, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26784] A function of VGAM642 is therefore inhibition of ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B.

Beta-1,3-glucuronyltransferase 1

(glucuronosyltransferase P) (B3GAT1, Accession NM\_018644) is another VGAM642 host target gene.

B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GAT1 BINDING

SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20718 and SEQ ID:27630 respectively, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26785] Another function of VGAM642 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. EGF-like-domain, Multiple 3 (EGFL3, Accession XM\_031401) is another VGAM642 host target gene. EGFL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL3 BINDING SITE, designated SEQ ID:31373, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26786] Another function of VGAM642 is therefore inhibition of EGF-like-domain, Multiple 3 (EGFL3, Accession XM\_031401). Accordingly, utilities of VGAM642 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL3. KIAA0513 (Accession NM\_014732) is another VGAM642 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16355, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26787] Another function of VGAM642 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. LOC149478 (Accession XM\_086536) is another VGAM642 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC149478 BINDING SITE, designated SEQ ID:38754, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26788] Another function of VGAM642 is therefore inhibition of LOC149478 (Accession XM\_086536). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC203378 (Accession XM\_117541) is another VGAM642 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43554, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26789] Another function of VGAM642 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC91179 (Accession XM\_036731) is another VGAM642 host target gene. LOC91179 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91179 BINDING SITE, designated SEQ ID:32492, to the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, also designated SEQ ID:3353.

[26790] Another function of VGAM642 is therefore inhibition of LOC91179 (Accession XM\_036731). Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 643 (VGAM643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26791] VGAM643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM643 was detected is described hereinabove with reference to Figs. 1-8.

[26792] VGAM643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat Cytomegalovirus. VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26793] VGAM643 gene encodes a VGAM643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM643 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM643 precursor RNA is designated SEQ ID:629, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:629 is located at position 112209 relative to the genome of Rat Cytomegalovirus.

[26794] VGAM643 precursor RNA folds onto itself, forming VGAM643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[26795] An enzyme complex designated DICER COMPLEX, `dices` the VGAM643 folded precursor RNA into VGAM643 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM643 RNA is designated SEQ ID:3354, and is provided hereinbelow with reference to the sequence listing part.

[26796] VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM643 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26797] VGAM643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM643 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM643 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[26798] The complementary binding of VGAM643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM643 host target RNA into VGAM643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26799] It is appreciated that VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM643 host target genes. The mRNA of each one of this plurality of VGAM643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM643 RNA, herein designated VGAM RNA, and which when bound by VGAM643 RNA causes inhibition of translation of respective one or more VGAM643 host target proteins.

[26800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM643 gene, herein designated VGAM GENE, on one or more VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26801] It is yet further appreciated that a function of VGAM643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of viral infection by Rat Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM643 correlate with, and may be deduced from, the identity of the host target genes which VGAM643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26802] Nucleotide sequences of the VGAM643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM643 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM643 are further described hereinbelow with reference to Table 1.

[26803] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM643 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26804] As mentioned hereinabove with reference to Fig. 1, a function of VGAM643 gene, herein designated VGAM is inhibition of expression of VGAM643 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM643 correlate with, and may be deduced from, the identity of the target genes which VGAM643 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26805] SMURF1 (Accession XM\_166483) is a VGAM643 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SMURF1 BINDING SITE, designated SEQ ID:44411, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26806] A function of VGAM643 is therefore inhibition of SMURF1 (Accession XM\_166483). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. FLJ12443 (Accession NM\_024830) is another VGAM643 host target gene. FLJ12443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12443 BINDING SITE, designated SEQ ID:24225, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26807] Another function of VGAM643 is therefore inhibition of FLJ12443 (Accession NM\_024830). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12443. KIAA0229 (Accession XM\_166478) is another VGAM643

host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44401, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26808] Another function of VGAM643 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA0674 (Accession XM\_027054) is another VGAM643 host target gene. KIAA0674 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0674 BINDING SITE, designated SEQ ID:30399, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26809] Another function of VGAM643 is therefore inhibition of KIAA0674 (Accession XM\_027054). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0674. KIAA0712 (Accession NM\_014715) is another VGAM643 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16264, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26810] Another function of VGAM643 is therefore inhibition of KIAA0712 (Accession NM\_014715). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. KIAA1229 (Accession XM\_030665) is another VGAM643 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31100, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26811] Another function of VGAM643 is therefore inhibition of KIAA1229 (Accession XM\_030665). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. Ring Finger Protein 10 (RNF10, Accession NM\_014868) is another VGAM643 host target gene. RNF10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF10 BINDING SITE, designated SEQ ID:16963, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26812] Another function of VGAM643 is therefore inhibition of Ring Finger Protein 10 (RNF10, Accession NM\_014868). Accordingly, utilities of VGAM643 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with RNF10. Serologically Defined Colon Cancer Antigen 43 (SDCCAG43, Accession XM\_046834) is another VGAM643 host target gene. SDCCAG43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG43 BINDING SITE, designated SEQ ID:34845, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26813] Another function of VGAM643 is therefore inhibition of Serologically Defined Colon Cancer Antigen 43 (SDCCAG43, Accession XM\_046834). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG43. SMOC2 (Accession XM\_051452) is another VGAM643 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35835, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26814] Another function of VGAM643 is therefore inhibition of SMOC2 (Accession XM\_051452). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. Stromal Antigen 2 (STAG2, Accession XM\_047285) is another VGAM643 host target gene. STAG2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAG2 BINDING SITE, designated SEQ ID:34931, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26815] Another function of VGAM643 is therefore inhibition of Stromal Antigen 2 (STAG2, Accession XM\_047285). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAG2. LOC253981 (Accession XM\_171064)

is another VGAM643 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45865, to the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, also designated SEQ ID:3354.

[26816] Another function of VGAM643 is therefore inhibition of LOC253981 (Accession XM\_171064). Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253981. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 644 (VGAM644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26817] VGAM644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM644 was detected is described

hereinabove with reference to Figs. 1–8.

[26818] VGAM644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26819] VGAM644 gene encodes a VGAM644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM644 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM644 precursor RNA is designated SEQ ID:630, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:630 is located at position 129 relative to the genome of Parvovirus H1.

[26820] VGAM644 precursor RNA folds onto itself, forming VGAM644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nu–

cleotide sequence of the second half thereof.

[26821] An enzyme complex designated DICER COMPLEX, `dices` the VGAM644 folded precursor RNA into VGAM644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM644 RNA is designated SEQ ID:3355, and is provided hereinbelow with reference to the sequence listing part.

[26822] VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM644 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26823] VGAM644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM644 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM644 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26824] The complementary binding of VGAM644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM644 host target RNA into VGAM644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26825] It is appreciated that VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM644 host target genes. The mRNA of each one of this plurality of VGAM644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM644 RNA, herein designated VGAM RNA, and which when bound by VGAM644 RNA causes inhibition of translation of respective one or more VGAM644 host target proteins.

[26826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM644 gene, herein designated VGAM GENE, on one or more VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26827] It is yet further appreciated that a function of VGAM644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM644 correlate with, and may be deduced from, the identity of the host target genes which VGAM644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26828] Nucleotide sequences of the VGAM644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM644 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM644 are further described hereinbelow with reference to Table 1.

[26829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM644 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26830] As mentioned hereinabove with reference to Fig. 1, a function of VGAM644 gene, herein designated VGAM is inhibition of expression of VGAM644 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM644 correlate with, and may be deduced from, the identity of the target genes which VGAM644 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26831] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_004996) is a VGAM644 host target gene. ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCC1, corresponding to HOST TARGET binding sites such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3, designated SEQ ID:11438, SEQ ID:21282 and SEQ ID:21286 respectively, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26832] A function of VGAM644 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_004996), a gene which may participate directly in the active transport of drugs into sub-cellular organelles or influence drug distribution indirectly. Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC1. The function of ABCC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM479.WW Domain Containing Oxidoreductase (WWOX, Accession NM\_016373) is another VGAM644 host target gene. WWOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWOX, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWOX BINDING SITE, designated SEQ ID:18503, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26833] Another function of VGAM644 is therefore inhibition of WW Domain Containing Oxidoreductase (WWOX, Accession NM\_016373), a gene which involves in protein-protein interactions and may contribute to the biologic consequences of DNA instability. Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWOX. The function of WWOX has been established by previous studies. To identify genes mapping to the chromosome region 16q23.3–q24.1, an area commonly affected by allelic loss in breast cancer, Bednarek et al. (2000) generated a detailed physical map of the genomic region spanning STS markers D16S518 and D16S516. By use of shotgun genomic sequencing as well as isolation and analysis of transcripts mapping to this region, they identified and cloned a novel gene, the genomic structure of which spanned the entire region. They designated the gene

WWOX because it contains 2 WW domains coupled to a region with high homology to the short-chain dehydrogenase/reductase (SRD) family of enzymes. The WWOX gene contains 9 exons and encodes a 414-amino acid protein. Bednarek et al. (2000) performed a mutation screen of WWOX exons in a panel of breast cancer lines, most of which were hemizygous for the 16q genomic region indicated. They found no evidence of mutations, indicating that WWOX is probably not a tumor suppressor gene. However, they observed that 1 case of homozygous deletion and 2 previously described translocation breakpoints map to intronic regions of this gene. They speculated that the WWOX gene may span the region of the common fragile site FRA16D. Northern blot analysis detected overexpression of a 2.2-kb WWOX transcript in breast cancer cell lines when compared to normal tissues. The highest normal expression was detected in hormonally regulated tissues such as testis, ovary, and prostate. This expression pattern and the presence of an SRD domain and specific amino acid features suggested a role for WWOX in steroid metabolism. The presence of WW domains indicated a role in protein-protein interactions. Chang et al. (2001) showed that the homologous mouse protein, Wox1, is an

essential mediator of tumor necrosis factor- $\alpha$ -induced apoptosis. Furthermore, mouse Wox1 protein binds directly to p53 (OMIM Ref. No. 191170), and blocking Wox1 by expression of antisense mRNA abolishes p53-mediated apoptosis in NIH 3T3 cells. The high conservation of WWOX protein between Homo sapiens and Mus musculus (93% identity) supported a similar, important role in apoptosis for human WWOX. In a mutation screen of WWOX in human cancer, Paige et al. (2001) demonstrated homozygous deletion of WWOX exons from ovarian cancer cells and 3 different tumor cell lines. They also identified an internally deleted WWOX transcript from a further primary ovarian tumor. In 3 of these samples the deletions resulted in frameshifts, and in each case the resulting WWOX transcripts lacked part, or all, of the short-chain dehydrogenase domain and the putative mitochondrial localization signal. Sequencing demonstrated several missense polymorphisms in tumor cell lines and identified a high level of single nucleotide polymorphism within the WWOX gene. The authors stated that the evidence strengthened the case for WWOX as a tumor suppressor gene in ovarian cancer and other tumor types. Bednarek et al. (2001) presented data indicating that WWOX behaves

as a potent suppressor of tumor growth and suggesting that abnormalities affecting this gene at the genomic and transcriptional level may be relevant in carcinogenesis. Two of the most frequently observed fragile sites in humans, FRA3B and FRA16D, show a high frequency of breakage and colocalize with genes crossing large regions of breakage. At FRA3B, the fragile histidine triad gene (FHIT; 601153) spans more than 1 Mb, and at FRA16D the WWOX gene spans more than 750 kb. In the mouse, the common fragile site Fra14A2 and the Fhit gene are conserved in the homologous region of the genome. Krummel et al. (2002) positioned the mouse homolog of WWOX (Wox1) at band 8E1 of the mouse genome, colocalizing with Fra8E1. The sequence from this region, including introns, is highly conserved over at least a 100-kb region. This evolutionary conservation suggests that the 2 most active common fragile sites share many features and that they and their associated genes may be necessary for cell survival.

[26834] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26835] Kuroki, T.; Trapasso, F.; Shiraishi, T.; Alder, H.; Mimori, K.;

Mori, M.; Croce, C. M. : Genetic alterations of the tumor suppressor gene WWOX in esophageal squamous cell carcinoma. Cancer Res. 62: 2258–2260, 2002. ; and

[26836] Paige, A. J. W.; Taylor, K. J.; Taylor, C.; Hillier, S. G.; Farrington, S.; Scott, D.; Porteous, D. J.; Smyth, J. F.; Gabra, H.; Watson, J. E. V. : WWOX: a candidate tumor suppressor ge.

[26837] Further studies establishing the function and utilities of WWOX are found in John Hopkins OMIM database record ID 605131, and in cited publications numbered 7084–708 and 4651–2874 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp762E1511 (Accession XM\_003460) is another VGAM644 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29935, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26838] Another function of VGAM644 is therefore inhibition of DKFZp762E1511 (Accession XM\_003460). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. KIAA0534 (Accession XM\_049349) is another VGAM644 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35388, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26839] Another function of VGAM644 is therefore inhibition of KIAA0534 (Accession XM\_049349). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1580 (Accession XM\_045271) is another VGAM644 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34405, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26840] Another function of VGAM644 is therefore inhibition of KIAA1580 (Accession XM\_045271). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. Retinoic Acid Induced 17 (RAI17, Accession XM\_166091) is another VGAM644 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43863, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26841] Another function of VGAM644 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM\_166091). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RAI17. SBBI26 (Accession NM\_018846) is another VGAM644 host target gene. SBBI26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBBI26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI26 BINDING SITE, designated SEQ ID:20831, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26842] Another function of VGAM644 is therefore inhibition of SBBI26 (Accession NM\_018846). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI26. LOC220018 (Accession XM\_167816) is another VGAM644 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220018 BINDING SITE, designated SEQ ID:44853, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA,

also designated SEQ ID:3355.

[26843] Another function of VGAM644 is therefore inhibition of LOC220018 (Accession XM\_167816). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220018. LOC254251 (Accession XM\_171088) is another VGAM644 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45897, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26844] Another function of VGAM644 is therefore inhibition of LOC254251 (Accession XM\_171088). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. LOC57086 (Accession NM\_020351) is another VGAM644 host target gene. LOC57086 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC57086, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:21616, to the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, also designated SEQ ID:3355.

[26845] Another function of VGAM644 is therefore inhibition of LOC57086 (Accession NM\_020351). Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 645 (VGAM645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26846] VGAM645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM645 was detected is described hereinabove with reference to Figs. 1–8.

[26847] VGAM645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM645

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26848] VGAM645 gene encodes a VGAM645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM645 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM645 precursor RNA is designated SEQ ID:631, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:631 is located at position 1 relative to the genome of Parvovirus H1.

[26849] VGAM645 precursor RNA folds onto itself, forming VGAM645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26850] An enzyme complex designated DICER COMPLEX, `dices` the VGAM645 folded precursor RNA into VGAM645 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM645 RNA is designated SEQ ID:3356, and is provided hereinbelow with reference to the sequence listing part.

[26851] VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM645 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26852] VGAM645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM645 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26853] The complementary binding of VGAM645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM645 host target RNA into VGAM645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[26854] It is appreciated that VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM645 host target genes. The mRNA of each one of this plurality of VGAM645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM645 RNA, herein designated VGAM RNA, and which when bound by VGAM645 RNA causes inhibition of translation of respective one or more VGAM645 host target proteins.

[26855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM645 gene, herein designated VGAM GENE, on one or more VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26856] It is yet further appreciated that a function of VGAM645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM645 include diagnosis, prevention and treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM645 correlate with, and may be deduced from, the identity of the host target genes which VGAM645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26857] Nucleotide sequences of the VGAM645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM645 are further described hereinbelow with reference to Table 1.

[26858] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM645 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM645 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26859] As mentioned hereinabove with reference to Fig. 1, a function of VGAM645 gene, herein designated VGAM is inhibition of expression of VGAM645 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM645 correlate with, and may be deduced from, the identity of the target genes which VGAM645 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26860] Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM\_021088) is a VGAM645 host target gene. ZNF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF2 BINDING SITE, designated SEQ ID:22065, to the nucleotide sequence of VGAM645 RNA, herein designated VGAM

RNA, also designated SEQ ID:3356.

- [26861] A function of VGAM645 is therefore inhibition of Zinc Finger Protein 2 (A1–5) (ZNF2, Accession NM\_021088). Accordingly, utilities of VGAM645 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 646 (VGAM646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [26862] VGAM646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM646 was detected is described hereinabove with reference to Figs. 1–8.
- [26863] VGAM646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lactate Dehydrogenase–elevating Virus. VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [26864] VGAM646 gene encodes a VGAM646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM646 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM646 precursor RNA is designated SEQ ID:632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:632 is located at position 1908 relative to the genome of Lactate Dehydrogenase-elevating Virus.

[26865] VGAM646 precursor RNA folds onto itself, forming VGAM646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26866] An enzyme complex designated DICER COMPLEX, `dices` the VGAM646 folded precursor RNA into VGAM646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM646 RNA is designated SEQ ID:3357, and is provided hereinbelow with reference to the sequence listing part.

[26867] VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM646 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26868] VGAM646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM646 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26869] The complementary binding of VGAM646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM646 host target RNA into VGAM646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26870] It is appreciated that VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM646 host target genes. The mRNA of

each one of this plurality of VGAM646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM646 RNA, herein designated VGAM RNA, and which when bound by VGAM646 RNA causes inhibition of translation of respective one or more VGAM646 host target proteins.

[26871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM646 gene, herein designated VGAM GENE, on one or more VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[26872] It is yet further appreciated that a function of VGAM646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of viral infection by Lactate Dehydrogenase-elevating Virus. Specific functions, and accordingly utilities, of VGAM646 correlate with, and may be deduced from, the identity of the host target genes which VGAM646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26873] Nucleotide sequences of the VGAM646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM646 are further described hereinbelow with reference to Table 1.

[26874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM646 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM646 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[26875] As mentioned hereinabove with reference to Fig. 1, a function of VGAM646 gene, herein designated VGAM is inhibition of expression of VGAM646 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM646 correlate with, and may be deduced from, the identity of the target genes which VGAM646 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26876] ABH (Accession XM\_007409) is a VGAM646 host target gene. ABH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABH BINDING SITE, designated SEQ ID:30054, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26877] A function of VGAM646 is therefore inhibition of ABH (Accession XM\_007409). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABH. Ox-

oxidative-stress Responsive 1 (OSR1, Accession NM\_005109) is another VGAM646 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11586, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26878] Another function of VGAM646 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM\_005109), a gene which mediates stress-activated signals. Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538.KIAA0408 (Accession NM\_014702) is another VGAM646 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16231, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26879] Another function of VGAM646 is therefore inhibition of KIAA0408 (Accession NM\_014702). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. PA26 (Accession NM\_014454) is another VGAM646 host target gene. PA26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PA26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PA26 BINDING SITE, designated SEQ ID:15805, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26880] Another function of VGAM646 is therefore inhibition of PA26 (Accession NM\_014454). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PA26. RENT2 (Accession NM\_015542) is another VGAM646 host target gene. RENT2 BINDING SITE1 and RENT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RENT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RENT2 BINDING SITE1 and RENT2 BINDING SITE2, designated SEQ ID:17802 and SEQ ID:27908 respectively, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26881] Another function of VGAM646 is therefore inhibition of RENT2 (Accession NM\_015542). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RENT2. LOC152245 (Accession XM\_098182) is another VGAM646 host target gene. LOC152245 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152245 BINDING

SITE, designated SEQ ID:41449, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26882] Another function of VGAM646 is therefore inhibition of LOC152245 (Accession XM\_098182). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245. LOC200933 (Accession XM\_117294) is another VGAM646 host target gene. LOC200933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200933 BINDING SITE, designated SEQ ID:43364, to the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, also designated SEQ ID:3357.

[26883] Another function of VGAM646 is therefore inhibition of LOC200933 (Accession XM\_117294). Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200933. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 647 (VGAM647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26884] VGAM647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM647 was detected is described hereinabove with reference to Figs. 1–8.

[26885] VGAM647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26886] VGAM647 gene encodes a VGAM647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM647 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM647 precursor RNA is designated SEQ ID:633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:633 is located at position 5839 relative to the genome of Acute

## Bee Paralysis Virus.

[26887] VGAM647 precursor RNA folds onto itself, forming VGAM647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26888] An enzyme complex designated DICER COMPLEX, `dices` the VGAM647 folded precursor RNA into VGAM647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM647 RNA is designated SEQ ID:3358, and is provided hereinbelow with reference to the sequence listing part.

[26889] VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM647 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26890] VGAM647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM647 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[26891] The complementary binding of VGAM647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM647 host target RNA into VGAM647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26892] It is appreciated that VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM647 host target genes. The mRNA of each one of this plurality of VGAM647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM647 RNA, herein designated VGAM RNA, and which when bound by VGAM647 RNA causes inhibition of translation of respective one or more VGAM647 host target proteins.

[26893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM647 gene, herein designated VGAM GENE, on one or more VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26894] It is yet further appreciated that a function of VGAM647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM647

correlate with, and may be deduced from, the identity of the host target genes which VGAM647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26895] Nucleotide sequences of the VGAM647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM647 are further described hereinbelow with reference to Table 1.

[26896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM647 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26897] As mentioned hereinabove with reference to Fig. 1, a function of VGAM647 gene, herein designated VGAM is inhibition of expression of VGAM647 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM647 correlate with, and may be deduced

from, the identity of the target genes which VGAM647 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26898] Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 2 (p85 beta) (PIK3R2, Accession NM\_005027) is a VGAM647 host target gene. PIK3R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R2 BINDING SITE, designated SEQ ID:11466, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26899] A function of VGAM647 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 2 (p85 beta) (PIK3R2, Accession NM\_005027), a gene which acts as an adapter and is regulatory subunit (p85 beta) of phosphatidylinositol 3-kinase. Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R2. The function of PIK3R2 has been established by previous studies. Otsu et al. (1991) showed that the bovine

PI3-kinase p85 subunit consists of 2 closely related proteins, p85-alpha (OMIM Ref. No. 171833) and p85-beta. They cloned cDNAs encoding both p85 subunits, each of which is 724 amino acids long. The subunits share 62% amino acid identity across their entire length. Both sequences contain an N-terminal SH3 region, 2 SH2 regions, and a region of homology to BCR (OMIM Ref. No. 151410). Functional expression studies showed that both p85 subunits bind to tyrosine kinase receptors. Janssen et al. (1998) analyzed DNA from a patient with chronic myeloproliferative disorder. They identified an oncogenic fusion of the 5-prime end of p85-beta and the 3-prime end of HUMORF8 (OMIM Ref. No. 603158). Janssen et al. (1998) determined the human p85-beta cDNA sequence.

[26900] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26901] Janssen, J. W. G.; Schleithoff, L.; Bartram, C. R.; Schulz, A. S. : An oncogenic fusion product of the phosphatidylinositol 3-kinase p85-beta subunit and HUMORF8, a putative deubiquitinating enzyme. *Oncogene* 16: 1767-1772, 1998. ; and

[26903] Further studies establishing the function and utilities of PIK3R2 are found in John Hopkins OMIM database record ID 603157, and in cited publications numbered 2427, 383 and 3842 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_002838) is another VGAM647 host target gene. PTPRC BINDING SITE1 and PTPRC BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE1 and PTPRC BINDING SITE2, designated SEQ ID:8718 and SEQ ID:28144 respectively, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26904] Another function of VGAM647 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_002838). Accordingly, utilities of VGAM647

include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. TAF5 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 100kDa (TAF5, Accession NM\_006951) is another VGAM647 host target gene. TAF5 BINDING SITE1 and TAF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TAF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF5 BINDING SITE1 and TAF5 BINDING SITE2, designated SEQ ID:13837 and SEQ ID:14337 respectively, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26905] Another function of VGAM647 is therefore inhibition of TAF5 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 100kDa (TAF5, Accession NM\_006951), a gene which is involved as a modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF5. The function of TAF5 has been established by previous studies. Dubrovskaya et al. (1996)

characterized a human TAF, called TAFII100 by them, which is homologous to *Drosophila* TAFII80 (65% similar) and yeast TAFII90 (57% similar). They cloned a TAFII100 cDNA that encodes a 799-amino acid polypeptide with a calculated molecular mass of 87.9 kD; however, both endogenous and recombinant proteins have an electrophoretically determined relative mass of 100 kD. By deletional analysis, Dubrovskaya et al. (1996) showed that the C-terminal, WD-40 repeat-containing domain is not required for incorporation into the TFIID complex. Independently, Tanese et al. (1996) cloned and characterized the C-terminal 801 amino acids of TAFII100. They suggested that, since the N-terminal amino acid sequence obtained from sequencing the endogenous protein is different from the N-terminal sequence predicted by the cloned gene, the full-length TAFII100 gene (also symbolized TAF2D) probably encodes a short peptide sequence upstream of their putative initiation methionine and that of Dubrovskaya et al. (1996).

[26906] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26907] Dubrovskaya, V.; Lavigne, A.-C.; Davidson, I.; Acker, J.;

Staub, A.; Tora, L. : Distinct domains of hTAFII100 are required for functional interaction with transcription factor TFIIF-beta (RAP30) and incorporation into the TFIID complex. EMBO J. 15: 3702-3712, 1996. ; and

[26908] Tanese, N.; Saluja, D.; Vassallo, M. F.; Chen, J.-L.; Admon, A. : Molecular cloning and analysis of two subunits of the human TFIID complex: hTAFII130 and hTAFII100. Proc. Nat. Acad. Sc.

[26909] Further studies establishing the function and utilities of TAF5 are found in John Hopkins OMIM database record ID 601787, and in cited publications numbered 1276-1279 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0061 (Accession XM\_043094) is another VGAM647 host target gene. KIAA0061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0061 BINDING SITE, designated SEQ ID:33894, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26910] Another function of VGAM647 is therefore inhibition of KIAA0061 (Accession XM\_043094). Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0061. NAG73 (Accession NM\_032570) is another VGAM647 host target gene. NAG73 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NAG73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAG73 BINDING SITE, designated SEQ ID:26301, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26911] Another function of VGAM647 is therefore inhibition of NAG73 (Accession NM\_032570). Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAG73. P450RAI-2 (Accession NM\_019885) is another VGAM647 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21266, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26912] Another function of VGAM647 is therefore inhibition of P450RAI-2 (Accession NM\_019885). Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. LOC123242 (Accession XM\_063548) is another VGAM647 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37249, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26913] Another function of VGAM647 is therefore inhibition of LOC123242 (Accession XM\_063548). Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC123242. LOC253001 (Accession XM\_171711) is another VGAM647 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46063, to the nucleotide sequence of VGAM647 RNA, herein designated VGAM RNA, also designated SEQ ID:3358.

[26914] Another function of VGAM647 is therefore inhibition of LOC253001 (Accession XM\_171711). Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 648 (VGAM648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26915] VGAM648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM648 was detected is described hereinabove with reference to Figs. 1–8.

[26916] VGAM648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26917] VGAM648 gene encodes a VGAM648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM648 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM648 precursor RNA is designated SEQ ID:634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:634 is located at position 5074 relative to the genome of Acute Bee Paralysis Virus.

[26918] VGAM648 precursor RNA folds onto itself, forming VGAM648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26919] An enzyme complex designated DICER COMPLEX, `dices` the VGAM648 folded precursor RNA into VGAM648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM648 RNA is designated SEQ ID:3359, and is provided hereinbelow with reference to the sequence listing part.

[26920] VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM648 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26921] VGAM648 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM648 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[26922] The complementary binding of VGAM648 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM648 host target RNA into VGAM648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26923] It is appreciated that VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM648 host target genes. The mRNA of each one of this plurality of VGAM648 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM648 RNA, herein designated VGAM RNA, and which when bound by VGAM648 RNA causes inhibition of translation of respective one or more VGAM648 host target proteins.

[26924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM648 gene, herein designated VGAM GENE, on one or more VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26925] It is yet further appreciated that a function of VGAM648 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM648 correlate with, and may be deduced from, the identity of the host target genes which VGAM648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26926] Nucleotide sequences of the VGAM648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM648 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM648 are further described hereinbelow with reference to Table 1.

[26927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM648 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26928] As mentioned hereinabove with reference to Fig. 1, a function of VGAM648 gene, herein designated VGAM is inhibition of expression of VGAM648 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM648 correlate with, and may be deduced from, the identity of the target genes which VGAM648 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26929] Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_000103) is a VGAM648 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untrans-

lated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:5561 and SEQ ID:25271 respectively, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26930] A function of VGAM648 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_000103), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508. Jerky Homolog (mouse) (JRK, Accession XM\_098818) is another VGAM648 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by JRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41835, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26931] Another function of VGAM648 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM\_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Killer Cell Lectin-like Receptor Subfamily G, Member 1 (KLRG1, Accession NM\_005810) is another VGAM648 host target gene. KLRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLRG1 BINDING SITE, designated SEQ ID:12392, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA,

also designated SEQ ID:3359.

[26932] Another function of VGAM648 is therefore inhibition of Killer Cell Lectin-like Receptor Subfamily G, Member 1 (KLRG1, Accession NM\_005810), a gene which plays a role in host defense;. Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRG1. The function of KLRG1 has been established by previous studies. Inhibitory lectin-like receptors expressed on the surface of hematopoietic cells regulate immunocyte effector functions through interactions with specific ligands. For example, major histocompatibility complex (MHC) class I molecules are recognized by natural killer (NK) cells. All of these inhibitory receptors contain a cytoplasmic immunoreceptor tyrosine-based inhibitory motif, or ITIM. Upon MHC I engagement and tyrosine phosphorylation of the ITIM, intracellular tyrosine protein phosphatases such as SHP1 (PTPN6; 176883) are recruited to the ITIM, and an inhibitory signal cascade leads to the abrogation of NK cell activation. By searching an EST database for sequences similar to the ITIM-bearing rat mast cell function-associated antigen (MAFA), Butcher et al. (1998) and Hanke et al. (1998) identified clones encoding KLRG1,

which Butcher et al. (1998) designated 'MAFA-like' (MAFAL). Using PCR analysis on a basophil-like leukemia cell line and human lung mast cells, Lamers et al. (1998) also isolated a cDNA encoding KLRG1, which they called MAFA. The deduced 189-amino acid KLRG1 is a type II transmembrane protein containing a C-type lectin carbohydrate recognition domain, an intracellular ITIM-like motif, and 4 potential N-glycosylation sites. Northern blot analysis by Butcher et al. (1998) detected a 1-kb KLRG1 transcript in spleen, lymph node, and peripheral blood leukocytes. By RT-PCR analysis, Butcher et al. (1998) found expression of KLRG1 in peripheral blood NK cells, a monocytic cell line, and a basophilic leukemia cell line; expression was not found in decidual NK cells, B cells, and T cells.

[26933] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26934] Lamers, M. B. A. C.; Lamont, A. G.; Williams, D. H. : Human MAFA has alternatively spliced variants. *Biochim. Biophys. Acta* 1399: 209-212, 1998. ; and

[26935] Voehringer, D.; Kaufmann, M.; Pircher, H. : Genomic structure, alternative splicing, and physical mapping of

the killer cell lectin-like receptor G1 gene (KLRG1), the mouse homologue of.

[26936] Further studies establishing the function and utilities of KLRG1 are found in John Hopkins OMIM database record ID 604874, and in cited publications numbered 6754–6757 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ERp44 (Accession XM\_088476) is another VGAM648 host target gene. ERp44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERp44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERp44 BINDING SITE, designated SEQ ID:39725, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26937] Another function of VGAM648 is therefore inhibition of ERp44 (Accession XM\_088476). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERp44. FLJ10546 (Accession XM\_002989) is another VGAM648 host target gene. FLJ10546 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ10546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10546 BINDING SITE, designated SEQ ID:29914, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26938] Another function of VGAM648 is therefore inhibition of FLJ10546 (Accession XM\_002989). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10546. FLJ21438 (Accession XM\_029084) is another VGAM648 host target gene. FLJ21438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21438 BINDING SITE, designated SEQ ID:30847, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26939] Another function of VGAM648 is therefore inhibition of

FLJ21438 (Accession XM\_029084). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21438. KIAA1115 (Accession NM\_014931) is another VGAM648 host target gene. KIAA1115 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1115 BINDING SITE, designated SEQ ID:17228, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26940] Another function of VGAM648 is therefore inhibition of KIAA1115 (Accession NM\_014931). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1115. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450) is another VGAM648 host target gene. SMARCF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCF1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE, designated SEQ ID:20522, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26941] Another function of VGAM648 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. LOC90297 (Accession XM\_030742) is another VGAM648 host target gene. LOC90297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90297 BINDING SITE, designated SEQ ID:31131, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26942] Another function of VGAM648 is therefore inhibition of

LOC90297 (Accession XM\_030742). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90297. LOC90785 (Accession XM\_034110) is another VGAM648 host target gene. LOC90785 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90785 BINDING SITE, designated SEQ ID:32007, to the nucleotide sequence of VGAM648 RNA, herein designated VGAM RNA, also designated SEQ ID:3359.

[26943] Another function of VGAM648 is therefore inhibition of LOC90785 (Accession XM\_034110). Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90785. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 649 (VGAM649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[26944] VGAM649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM649 was detected is described hereinabove with reference to Figs. 1–8.

[26945] VGAM649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26946] VGAM649 gene encodes a VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM649 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM649 precursor RNA is designated SEQ ID:635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:635 is located at position 5290 relative to the genome of Acute Bee Paralysis Virus.

[26947] VGAM649 precursor RNA folds onto itself, forming VGAM649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[26948] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM649 folded precursor RNA into VGAM649 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 81%) nucleotide se-  
quence of VGAM649 RNA is designated SEQ ID:3360, and  
is provided hereinbelow with reference to the sequence  
listing part.

[26949] VGAM649 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM649 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM649 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[26950] VGAM649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM649 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM649 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[26951] The complementary binding of VGAM649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM649 host target RNA into VGAM649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26952] It is appreciated that VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM649 host target genes. The mRNA of each one of this plurality of VGAM649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM649 RNA, herein designated VGAM RNA, and which when bound by VGAM649 RNA causes inhibition of translation of respective one or more VGAM649 host target proteins.

[26953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM649 gene, herein designated VGAM GENE, on one or

more VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26954] It is yet further appreciated that a function of VGAM649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM649 correlate with, and may be deduced from, the identity of the host target genes which VGAM649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [26955] Nucleotide sequences of the VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM649 are further described hereinbelow with reference to Table 1.
- [26956] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM649 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [26957] As mentioned hereinabove with reference to Fig. 1, a function of VGAM649 gene, herein designated VGAM is inhibition of expression of VGAM649 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM649 correlate with, and may be deduced from, the identity of the target genes which VGAM649 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [26958] Forkhead Box E3 (FOX E3, Accession NM\_012186) is a

VGAM649 host target gene. FOXE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXE3 BINDING SITE, designated SEQ ID:14470, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26959] A function of VGAM649 is therefore inhibition of Forkhead Box E3 (FOXE3, Accession NM\_012186), a gene which regulates embryonic development. Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE3. The function of FOXE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_004631) is another VGAM649 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:11008 and SEQ ID:27132 respectively, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26960] Another function of VGAM649 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_004631), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112) is another VGAM649 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15359, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26961] Another function of VGAM649 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Wilms Tumor 1 (WT1, Accession NM\_024424) is another VGAM649 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23669, SEQ ID:23673, SEQ

ID:23677 and SEQ ID:5953 respectively, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26962] Another function of VGAM649 is therefore inhibition of Wilms Tumor 1 (WT1, Accession NM\_024424). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. DAMS (Accession NM\_022001) is another VGAM649 host target gene. DAMS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAMS BINDING SITE, designated SEQ ID:22543, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26963] Another function of VGAM649 is therefore inhibition of DAMS (Accession NM\_022001). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAMS. DRIL2 (Accession NM\_006465) is another VGAM649 host target gene. DRIL2 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13191, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26964] Another function of VGAM649 is therefore inhibition of DRIL2 (Accession NM\_006465). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ13102 (Accession NM\_024887) is another VGAM649 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24346, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26965] Another function of VGAM649 is therefore inhibition of

FLJ13102 (Accession NM\_024887). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. FLJ20033 (Accession NM\_017629) is another VGAM649 host target gene. FLJ20033 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20033 BINDING SITE, designated SEQ ID:19127, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26966] Another function of VGAM649 is therefore inhibition of FLJ20033 (Accession NM\_017629). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20033. FLJ23441 (Accession NM\_024678) is another VGAM649 host target gene. FLJ23441 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ23441 BINDING SITE, designated SEQ ID:23987, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26967] Another function of VGAM649 is therefore inhibition of FLJ23441 (Accession NM\_024678). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23441. KIAA1735 (Accession XM\_113686) is another VGAM649 host target gene. KIAA1735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE, designated SEQ ID:42344, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26968] Another function of VGAM649 is therefore inhibition of KIAA1735 (Accession XM\_113686). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735. MGC2452 (Accession NM\_032644) is another

VGAM649 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26368, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26969] Another function of VGAM649 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. LOC150225 (Accession XM\_097870) is another VGAM649 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41186, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26970] Another function of VGAM649 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC157627 (Accession XM\_088347) is another VGAM649 host target gene. LOC157627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:39622, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26971] Another function of VGAM649 is therefore inhibition of LOC157627 (Accession XM\_088347). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627. LOC196264 (Accession XM\_113683) is another VGAM649 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42330, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26972] Another function of VGAM649 is therefore inhibition of LOC196264 (Accession XM\_113683). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC253832 (Accession XM\_170739) is another VGAM649 host target gene. LOC253832 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253832 BINDING SITE, designated SEQ ID:45499, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26973] Another function of VGAM649 is therefore inhibition of LOC253832 (Accession XM\_170739). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253832. LOC255082 (Accession XM\_172843) is another VGAM649 host target gene. LOC255082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255082 BINDING SITE, designated SEQ ID:46116, to the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, also designated SEQ ID:3360.

[26974] Another function of VGAM649 is therefore inhibition of LOC255082 (Accession XM\_172843). Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 650 (VGAM650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26975] VGAM650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM650 was detected is described hereinabove with reference to Figs. 1–8.

[26976] VGAM650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26977] VGAM650 gene encodes a VGAM650 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM650 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM650 precursor RNA is designated SEQ ID:636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:636 is located at position 10659 relative to the genome of Saimiriine Herpesvirus 2.

[26978] VGAM650 precursor RNA folds onto itself, forming VGAM650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[26979] An enzyme complex designated DICER COMPLEX, `dices` the VGAM650 folded precursor RNA into VGAM650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM650 RNA is designated SEQ ID:3361, and is provided hereinbelow with reference to the sequence listing part.

[26980] VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM650 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[26981] VGAM650 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM650 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[26982] The complementary binding of VGAM650 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM650 host target RNA into VGAM650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[26983] It is appreciated that VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM650 host target genes. The mRNA of each one of this plurality of VGAM650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM650 RNA, herein designated VGAM RNA, and which when bound by VGAM650 RNA causes inhibition of translation of respective one or more VGAM650 host target proteins.

[26984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM650 gene, herein designated VGAM GENE, on one or more VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[26985] It is yet further appreciated that a function of VGAM650 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM650 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM650 correlate with, and may be deduced from, the identity of the host target genes which VGAM650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[26986] Nucleotide sequences of the VGAM650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM650 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM650 are further described hereinbelow with reference to Table 1.

[26987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM650 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[26988] As mentioned hereinabove with reference to Fig. 1, a function of VGAM650 gene, herein designated VGAM is inhibition of expression of VGAM650 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM650 correlate with, and may be deduced from, the identity of the target genes which VGAM650 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[26989] Chorea Acanthocytosis (CHAC, Accession NM\_033305) is a VGAM650 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHAC, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:27138, to the nucleotide sequence of VGAM650 RNA, herein designated VGAM RNA, also designated SEQ ID:3361.

[26990] A function of VGAM650 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM\_033305), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC has been established by previous studies. Rampoldi et al. (2001) identified a novel gene in the choreoacanthocytosis (CHAC; 200150) critical region of 9q with an open reading frame of 9,525 nucleotides encoding a 3,174-amino acid protein. Alignment of the RNA with the genomic sequence demonstrated that the gene is organized into 73 exons in a genomic region of about 250 kb. Northern blot analysis detected 2 bands of high molecular weight corresponding to 2 splice variants in all tissues analyzed. Additionally, RT-PCR detected expression in the erythrocyte precursor cell line K562. Rampoldi et al. (2001) found 16 different mutations in in-

dividuals with choreoacanthocytosis. They showed that the CHAC gene encodes an evolutionarily conserved protein and suggested that this protein is involved in protein sorting. In a patient with choreoacanthocytosis (OMIM Ref. No. 200150), Rampoldi et al. (2001) found compound heterozygosity for a 269T→A transversion in exon 4 of the CHAC gene and an insertion of a T between nucleotides 6404 and 6405 in exon 48. The mutations resulted in an ile90→lys (I90K) amino acid change and a frameshift, respectively.

[26991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[26992] Rampoldi, L.; Dobson-Stone, C.; Rubio, J. P.; Danek, A.; Chalmers, R. M.; Wood, N. W.; Verellen, C.; Ferrer, X.; Mallandrini, A.; Fabrizi, G. M.; Brown, R.; Vance, J.; Pericak-Vance, M.; Rudolf, G.; Carre, S.; Alonso, E.; Manfredi, M.; Nemeth, A. H.; Monaco, A. P. : A conserved sorting-associated protein is mutant in chorea-acanthocytosis. *Nature Genet.* 28: 119–120, 2001. ; and

[26993] Ueno, S.; Maruki, Y.; Nakamura, M.; Tomemori, Y.; Kamae, K.; Tanabe, H.; Yamashita, Y.; Matsuda, S.; Kaneko, S.; Sano, A. : The gene encoding a newly discovered protein,

chorein, is mu.

[26994] Further studies establishing the function and utilities of CHAC are found in John Hopkins OMIM database record ID 605978, and in cited publications numbered 10457 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. HTEX4 (Accession XM\_166378) is another VGAM650 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44212, SEQ ID:46648 and SEQ ID:46717 respectively, to the nucleotide sequence of VGAM650 RNA, herein designated VGAM RNA, also designated SEQ ID:3361.

[26995] Another function of VGAM650 is therefore inhibition of HTEX4 (Accession XM\_166378). Accordingly, utilities of VGAM650 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 651 (VGAM651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[26996] VGAM651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM651 was detected is described hereinabove with reference to Figs. 1–8.

[26997] VGAM651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[26998] VGAM651 gene encodes a VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM651 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM651 precursor RNA is designated SEQ ID:637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:637 is located at position 57033 relative to the genome of Meleagrid Herpesvirus 1.

[26999] VGAM651 precursor RNA folds onto itself, forming VGAM651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27000] An enzyme complex designated DICER COMPLEX, `dices` the VGAM651 folded precursor RNA into VGAM651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM651 RNA is designated SEQ ID:3362, and is provided hereinbelow with reference to the sequence listing part.

[27001] VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM651 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM651 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27002] VGAM651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM651 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27003] The complementary binding of VGAM651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM651 host target RNA into VGAM651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27004] It is appreciated that VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM651 host target genes. The mRNA of each one of this plurality of VGAM651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM651 RNA, herein designated VGAM RNA, and which when bound by VGAM651 RNA causes inhibition of translation of respective one or more VGAM651 host target proteins.

[27005] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM651 gene, herein designated VGAM GENE, on one or more VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27006] It is yet further appreciated that a function of VGAM651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM651 correlate with, and may be deduced from, the identity of

the host target genes which VGAM651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27007] Nucleotide sequences of the VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM651 are further described hereinbelow with reference to Table 1.

[27008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM651 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27009] As mentioned hereinabove with reference to Fig. 1, a function of VGAM651 gene, herein designated VGAM is inhibition of expression of VGAM651 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM651 correlate with, and may be deduced from, the identity of the target genes which VGAM651

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27010] DKFZP434I092 (Accession XM\_042042) is a VGAM651 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33674, to the nucleotide sequence of VGAM651 RNA, herein designated VGAM RNA, also designated SEQ ID:3362.

[27011] A function of VGAM651 is therefore inhibition of DKFZP434I092 (Accession XM\_042042). Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. KIAA0556 (Accession XM\_044632) is another VGAM651 host target gene. KIAA0556 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0556 BINDING SITE, designated SEQ ID:34252, to the nucleotide sequence of VGAM651 RNA, herein designated VGAM RNA, also designated SEQ ID:3362.

[27012] Another function of VGAM651 is therefore inhibition of KIAA0556 (Accession XM\_044632). Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0556. LIG-1 (Accession XM\_033712) is another VGAM651 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31951, to the nucleotide sequence of VGAM651 RNA, herein designated VGAM RNA, also designated SEQ ID:3362.

[27013] Another function of VGAM651 is therefore inhibition of LIG-1 (Accession XM\_033712). Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. LOC164382 (Accession XM\_104390) is another VGAM651 host target gene. LOC164382 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42163, to the nucleotide sequence of VGAM651 RNA, herein designated VGAM RNA, also designated SEQ ID:3362.

[27014] Another function of VGAM651 is therefore inhibition of LOC164382 (Accession XM\_104390). Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 652 (VGAM652) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27015] VGAM652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM652 was detected is described hereinabove with reference to Figs. 1-8.

[27016] VGAM652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27017] VGAM652 gene encodes a VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM652 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM652 precursor RNA is designated SEQ ID:638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:638 is located at position 62005 relative to the genome of Meleagrid Herpesvirus 1.

[27018] VGAM652 precursor RNA folds onto itself, forming VGAM652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[27019] An enzyme complex designated DICER COMPLEX, `dices` the VGAM652 folded precursor RNA into VGAM652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM652 RNA is designated SEQ ID:3363, and is provided hereinbelow with reference to the sequence listing part.

[27020] VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM652 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27021] VGAM652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM652 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM652 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[27022] The complementary binding of VGAM652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM652 host target RNA into VGAM652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27023] It is appreciated that VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM652 host target genes. The mRNA of each one of this plurality of VGAM652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM652 RNA, herein designated VGAM RNA, and which when bound by VGAM652 RNA causes inhibition of translation of respective one or more VGAM652 host target proteins.

[27024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM652 gene, herein designated VGAM GENE, on one or more VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27025] It is yet further appreciated that a function of VGAM652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM652 correlate with, and may be deduced from, the identity of the host target genes which VGAM652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27026] Nucleotide sequences of the VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM652 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM652 are further described hereinbelow with reference to Table 1.

[27027] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM652 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27028] As mentioned hereinabove with reference to Fig. 1, a function of VGAM652 gene, herein designated VGAM is inhibition of expression of VGAM652 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM652 correlate with, and may be deduced from, the identity of the target genes which VGAM652 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27029] A Disintegrin and Metalloproteinase Domain 29 (ADAM29, Accession XM\_113428) is a VGAM652 host target gene. ADAM29 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ADAM29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ADAM29 BINDING SITE, designated SEQ ID:42261, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27030] A function of VGAM652 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 29 (ADAM29, Accession XM\_113428), a gene which Testis-specific member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM29. The function of ADAM29 has been established by previous studies. ADAMs are a family of cell surface proteins with a domain structure composed of a signal sequence, a prodomain with a cysteine switch, a metalloproteinase-like domain, a disintegrin-like domain, a cysteine-rich domain, a transmembrane domain, and a C-terminal cytoplasmic domain. Members of this family have been implicated in a variety of biologic processes involving cell-cell and cell-matrix interactions, including fertilization, muscle development, and neurogenesis. By searching a DNA sequence database, Cerretti et al. (1999) identified 2 ESTs representing the novel ADAMs ADAM29

and ADAM30 (OMIM Ref. No. 604779). The ADAM29 EST encodes a polypeptide with sequence similarity to the cysteine-rich region of ADAM20 (OMIM Ref. No. 603712). Cerretti et al. (1999) screened a human testis cDNA library with the ADAM29 EST and isolated cDNAs encoding 3 forms of ADAM29 that differ in the cytoplasmic domain. By searching an EST database using ADAM20 as the query, Xu et al. (1999) identified an ADAM29 EST. Using a PCR-based 'walking' strategy, they cloned a full-length ADAM29 coding sequence. By radiation hybrid mapping, Xu et al. (1999) mapped the ADAM29 gene to 4q34.2-qter. Cerretti et al. (1999) mapped the ADAM29 gene to 4q34 using radiation hybrid mapping.

[27031] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27032] Cerretti, D. P.; DuBose, R. F.; Black, R. A.; Nelson, N. : Isolation of two novel metalloproteinase-disintegrin (ADAM) cDNAs that show testis-specific gene expression. Biochem. Biophys. Res. Commun. 263: 810-815, 1999. ; and

[27033] Xu, R.; Cai, J.; Xu, T.; Zhou, W.; Ying, B.; Deng, K.; Zhao, S.; Li, C. : Molecular cloning and mapping of a novel ADAM

gene (ADAM29) to human chromosome 4. Genomics 62: 537–539, 1999.

[27034] Further studies establishing the function and utilities of ADAM29 are found in John Hopkins OMIM database record ID 604778, and in cited publications numbered 6649–6650 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129) is another VGAM652 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BINDING SITE, designated SEQ ID:34691, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27035] Another function of VGAM652 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129), a gene which ubiquitinates regulatory proteins involved in transcription. Accordingly, utilities of VGAM652 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. E2F Transcription Factor 6 (E2F6, Accession NM\_001952) is another VGAM652 host target gene. E2F6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F6 BINDING SITE, designated SEQ ID:7675, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27036] Another function of VGAM652 is therefore inhibition of E2F Transcription Factor 6 (E2F6, Accession NM\_001952). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F6. ENDOGLYX1 (Accession NM\_024756) is another VGAM652 host target gene. ENDOGLYX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ENDOGLYX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOGLYX1 BINDING SITE, designated SEQ ID:24102, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27037] Another function of VGAM652 is therefore inhibition of ENDOGLYX1 (Accession NM\_024756). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOGLYX1. FLJ22795 (Accession NM\_025084) is another VGAM652 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24687, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27038] Another function of VGAM652 is therefore inhibition of FLJ22795 (Accession NM\_025084). Accordingly, utilities of

VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795. MGC22014 (Accession XM\_035307) is another VGAM652 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32215, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27039] Another function of VGAM652 is therefore inhibition of MGC22014 (Accession XM\_035307). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. LOC145717 (Accession XM\_039771) is another VGAM652 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145717 BINDING SITE, designated SEQ ID:33188, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27040] Another function of VGAM652 is therefore inhibition of LOC145717 (Accession XM\_039771). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC145725 (Accession XM\_085211) is another VGAM652 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37945, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27041] Another function of VGAM652 is therefore inhibition of LOC145725 (Accession XM\_085211). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM\_085218) is another VGAM652 host target gene. LOC145732 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37954, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27042] Another function of VGAM652 is therefore inhibition of LOC145732 (Accession XM\_085218). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC149076 (Accession XM\_086415) is another VGAM652 host target gene. LOC149076 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149076 BINDING SITE, designated SEQ ID:38636, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27043] Another function of VGAM652 is therefore inhibition of

LOC149076 (Accession XM\_086415). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149076. LOC196326 (Accession XM\_118268) is another VGAM652 host target gene. LOC196326 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196326 BINDING SITE, designated SEQ ID:43576, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27044] Another function of VGAM652 is therefore inhibition of LOC196326 (Accession XM\_118268). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196326. LOC196957 (Accession XM\_113789) is another VGAM652 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42427, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27045] Another function of VGAM652 is therefore inhibition of LOC196957 (Accession XM\_113789). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM\_113790) is another VGAM652 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42436, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27046] Another function of VGAM652 is therefore inhibition of LOC196961 (Accession XM\_113790). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM\_113829) is an-

other VGAM652 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42454, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27047] Another function of VGAM652 is therefore inhibition of LOC197138 (Accession XM\_113829). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC220537 (Accession XM\_165406) is another VGAM652 host target gene. LOC220537 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43620, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27048] Another function of VGAM652 is therefore inhibition of LOC220537 (Accession XM\_165406). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC245727 (Accession XM\_165913) is another VGAM652 host target gene. LOC245727 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43795, to the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, also designated SEQ ID:3363.

[27049] Another function of VGAM652 is therefore inhibition of LOC245727 (Accession XM\_165913). Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245727. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 653 (VGAM653) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[27050] VGAM653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM653 was detected is described hereinabove with reference to Figs. 1–8.

[27051] VGAM653 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27052] VGAM653 gene encodes a VGAM653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM653 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM653 precursor RNA is designated SEQ ID:639, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:639 is located at position 62995 relative to the genome of Meleagrid Herpesvirus 1.

[27053] VGAM653 precursor RNA folds onto itself, forming VGAM653 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[27054] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM653 folded precursor RNA into VGAM653 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 80%) nucleotide se-  
quence of VGAM653 RNA is designated SEQ ID:3364, and  
is provided hereinbelow with reference to the sequence  
listing part.

[27055] VGAM653 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM653 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM653 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27056] VGAM653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM653 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27057] The complementary binding of VGAM653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM653 host target RNA into VGAM653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27058] It is appreciated that VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM653 host target genes. The mRNA of each one of this plurality of VGAM653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM653 RNA, herein designated VGAM RNA, and which when bound by VGAM653 RNA causes inhibition of translation of respective one or more VGAM653 host target proteins.

[27059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM653 gene, herein designated VGAM GENE, on one or more VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27060] It is yet further appreciated that a function of VGAM653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM653 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM653 correlate with, and may be deduced from, the identity of the host target genes which VGAM653 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [27061] Nucleotide sequences of the VGAM653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM653 are further described hereinbelow with reference to Table 1.
- [27062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM653 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [27063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM653 gene, herein designated VGAM is inhibition of expression of VGAM653 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM653 correlate with, and may be deduced from, the identity of the target genes which VGAM653 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27064] Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM\_018727) is a VGAM653 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:20809, SEQ ID:27989, SEQ ID:27997 and SEQ ID:28005 respectively, to the nucleotide sequence of VGAM653 RNA, herein designated VGAM RNA, also designated SEQ ID:3364.

[27065] A function of VGAM653 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM\_018727), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.LOC255147 (Accession XM\_171024) is an-

other VGAM653 host target gene. LOC255147 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255147 BINDING SITE, designated SEQ ID:45802, to the nucleotide sequence of VGAM653 RNA, herein designated VGAM RNA, also designated SEQ ID:3364.

[27066] Another function of VGAM653 is therefore inhibition of LOC255147 (Accession XM\_171024). Accordingly, utilities of VGAM653 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255147. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 654 (VGAM654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27067] VGAM654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM654 was detected is described

hereinabove with reference to Figs. 1–8.

[27068] VGAM654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27069] VGAM654 gene encodes a VGAM654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM654 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM654 precursor RNA is designated SEQ ID:640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:640 is located at position 75545 relative to the genome of Meleagrid Herpesvirus 1.

[27070] VGAM654 precursor RNA folds onto itself, forming VGAM654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27071] An enzyme complex designated DICER COMPLEX, `dices` the VGAM654 folded precursor RNA into VGAM654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM654 RNA is designated SEQ ID:3365, and is provided hereinbelow with reference to the sequence listing part.

[27072] VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM654 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27073] VGAM654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM654 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27074] The complementary binding of VGAM654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM654 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM654 host target RNA into VGAM654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27075] It is appreciated that VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM654 host target genes. The mRNA of each one of this plurality of VGAM654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM654 RNA, herein designated VGAM RNA, and which when bound by VGAM654 RNA causes inhibition of translation of respective one or more VGAM654 host target proteins.

[27076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM654 gene, herein designated VGAM GENE, on one or more VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27077] It is yet further appreciated that a function of VGAM654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM654 correlate with, and may be deduced from, the identity of the host target genes which VGAM654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27078] Nucleotide sequences of the VGAM654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM654 are further described hereinbelow with reference to Table 1.

[27079] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM654 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27080] As mentioned hereinabove with reference to Fig. 1, a function of VGAM654 gene, herein designated VGAM is inhibition of expression of VGAM654 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM654 correlate with, and may be deduced from, the identity of the target genes which VGAM654 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27081] Centrosomal Protein 2 (CEP2, Accession NM\_006779) is a VGAM654 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:13649, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27082] A function of VGAM654 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM\_006779), a gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.DKFZP564I052 (Accession XM\_039660) is another VGAM654 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:33138, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3365.

[27083] Another function of VGAM654 is therefore inhibition of DKFZP564I052 (Accession XM\_039660). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM\_012384) is another VGAM654 host target gene. GMEB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMEB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMEB2 BINDING SITE, designated SEQ ID:14741, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27084] Another function of VGAM654 is therefore inhibition of Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM\_012384). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMEB2. KIAA1024 (Accession XM\_044580) is another VGAM654 host target gene. KIAA1024 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34232, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27085] Another function of VGAM654 is therefore inhibition of KIAA1024 (Accession XM\_044580). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. MGC27434 (Accession NM\_145050) is another VGAM654 host target gene. MGC27434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC27434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27434 BINDING SITE, designated SEQ ID:29681, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27086] Another function of VGAM654 is therefore inhibition of

MGC27434 (Accession NM\_145050). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27434. Tousled-like Kinase 2 (TLK2, Accession XM\_085650) is another VGAM654 host target gene. TLK2 BINDING SITE1 and TLK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TLK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLK2 BINDING SITE1 and TLK2 BINDING SITE2, designated SEQ ID:38276 and SEQ ID:13722 respectively, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27087] Another function of VGAM654 is therefore inhibition of Tousled-like Kinase 2 (TLK2, Accession XM\_085650). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLK2. LOC151584 (Accession XM\_098089) is another VGAM654 host target gene. LOC151584 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151584, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151584 BINDING SITE, designated SEQ ID:41377, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27088] Another function of VGAM654 is therefore inhibition of LOC151584 (Accession XM\_098089). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151584. LOC221410 (Accession XM\_166373) is another VGAM654 host target gene. LOC221410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221410 BINDING SITE, designated SEQ ID:44196, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27089] Another function of VGAM654 is therefore inhibition of LOC221410 (Accession XM\_166373). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC221410. LOC257249 (Accession XM\_171092) is another VGAM654 host target gene. LOC257249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257249 BINDING SITE, designated SEQ ID:45904, to the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, also designated SEQ ID:3365.

[27090] Another function of VGAM654 is therefore inhibition of LOC257249 (Accession XM\_171092). Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 655 (VGAM655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27091] VGAM655 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM655 was detected is described hereinabove with reference to Figs. 1–8.

[27092] VGAM655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27093] VGAM655 gene encodes a VGAM655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM655 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM655 precursor RNA is designated SEQ ID:641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:641 is located at position 76605 relative to the genome of Meleagrid Herpesvirus 1.

[27094] VGAM655 precursor RNA folds onto itself, forming VGAM655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM655 folded precursor RNA into VGAM655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM655 RNA is designated SEQ ID:3366, and is provided hereinbelow with reference to the sequence listing part.

[27096] VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM655 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27097] VGAM655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM655 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[27098] The complementary binding of VGAM655 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM655 host target RNA into VGAM655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27099] It is appreciated that VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM655 host target genes. The mRNA of each one of this plurality of VGAM655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM655 RNA, herein designated VGAM RNA, and which when bound by VGAM655 RNA causes inhibition of translation of respective one or more VGAM655 host target proteins.

[27100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM655 gene, herein designated VGAM GENE, on one or more VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27101] It is yet further appreciated that a function of VGAM655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM655 correlate with, and may be deduced from, the identity of the host target genes which VGAM655 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[27102] Nucleotide sequences of the VGAM655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM655 are further described hereinbelow with reference to Table 1.

[27103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM655 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[27104] As mentioned hereinabove with reference to Fig. 1, a function of VGAM655 gene, herein designated VGAM is inhibition of expression of VGAM655 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM655 correlate with, and may be deduced from, the identity of the target genes which VGAM655 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27105] Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM\_000681) is a VGAM655 host target gene. ADRA2A BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by ADRA2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2A BINDING SITE, designated SEQ ID:6335, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27106] A function of VGAM655 is therefore inhibition of Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM\_000681), a gene which mediates the effects of epinephrine and norepinephrine. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA2A. The function of ADRA2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM602. Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000645) is another VGAM655 host target gene. AGL BINDING SITE1 through AGL BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by AGL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING SITE1 through AGL BINDING SITE6, designated SEQ ID:6296, SEQ ID:6303, SEQ ID:5464, SEQ ID:6281, SEQ ID:6286 and SEQ ID:6291 respectively, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27107] Another function of VGAM655 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000645). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL. Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM\_002747) is another VGAM655 host target gene. MAPK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ

ID:8620, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27108] Another function of VGAM655 is therefore inhibition of Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM\_002747), a gene which phosphorylates microtubule-associated protein-2 may promote entry into the cell cycle. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK4. The function of MAPK4 has been established by previous studies. See MAPK1 (OMIM Ref. No. 176948). Gonzalez et al. (1992) reported the molecular cloning of genes for 4 human proteins with high homology to members of the mitogen-activated protein kinase group of enzymes. Of the 4, 2 probably resulted from alternative processing of transcripts from a single gene. Zhu et al. (1994) stated that p63MAPK, which had been known as ERK3, shares only 73% protein sequence identity with rat ERK3. They suggested that p97MAPK (MAPK6; 602904) is the true ERK3 homolog, and that p63MAPK is a member of the ERK3 subfamily. Garcia et al. (1996) reported that a gene they referred to as MNK2 is the rat homolog of p63MAPK. The 2 protein se-

quences are 95% identical. Li et al. (1994) used Southern blotting of DNA from a panel of human hamster cell hybrids and fluorescence in situ hybridization to map the MAPK4 gene to 18q12–q21

[27109] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27110] Garcia, J. I.; Zalba, G.; Detera-Wadleigh, S. D.; de Miguel, C. : Isolation of a cDNA encoding the rat MAP–kinase homolog of human p63mapk. Mammalian Genome 7: 810–814, 1996. ; and

[27111] Li, L.; Wylk, M.; Gonzalez, F. A.; Davis, R. J. : Genomic loci of human mitogen–activated protein kinases. Oncogene 9: 647–649, 1994.

[27112] Further studies establishing the function and utilities of MAPK4 are found in John Hopkins OMIM database record ID 176949, and in cited publications numbered 1540–1541, 153 and 1542 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind–like (Drosophila) (MBNL, Accession NM\_021038) is another VGAM655 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBNL, corre–

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22022, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27113] Another function of VGAM655 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM\_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM\_001244) is another VGAM655 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING

SITE, designated SEQ ID:6914, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27114] Another function of VGAM655 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM\_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF8. The function of TNFSF8 has been established by previous studies. CD30 (TNFRSF8; 153243), a member of the tumor necrosis factor (TNF; OMIM Ref. No. TNF-alpha 191160) receptor superfamily, is a surface antigen used as a clinical marker for Hodgkin lymphoma and related hematologic malignancies. By performing an expression cloning screen using a chimeric protein containing the extracellular domain of CD30 as a probe, Smith et al. (1993) identified murine cells expressing a CD30 ligand. They isolated the corresponding mouse cDNA and used it to recover a homologous human cDNA from a peripheral blood T-cell (PBT) library. The predicted 234-amino acid human CD30L (CD30 ligand) protein is 72% identical to mouse Cd30l. CD30L has the

characteristics of a type II membrane protein, with no apparent signal peptide and a transmembrane domain followed by a C-terminal extracellular domain. The C-terminal receptor-binding region of CD30L shares sequence similarity with other members of the TNF family, including TNF-alpha, TNF-beta (OMIM Ref. No. 153440), and CD40LG (OMIM Ref. No. 300386). Although it has a predicted molecular weight of 26 kD, recombinant CD30L expressed in mammalian cells migrated at 40 kD by SDS-PAGE. Smith et al. (1993) attributed this discrepancy to extensive glycosylation of the extracellular domain in vivo. The recombinant human CD30L enhanced the proliferation of CD3 (OMIM Ref. No. 186790)-activated T cells, but induced differential responses, including cell death, in several CD30-positive lymphoma-derived cell lines. Northern blot analysis suggested that CD30L expression is limited to specifically induced T cells and monocytes/macrophages. Croager and Abraham (1997) determined that the CD30L gene contains 4 exons and spans more than 17.1 kb. Cerutti et al. (2000) noted that CD153 is expressed on the surface of B cells and found that this expression is upregulated upon CD154 (OMIM Ref. No. CD40LG), IL4 (OMIM Ref. No. 147780), and B-cell receptor

engagement. In these cells, engagement of CD153 by T cell CD30 inhibits immunoglobulin class switch recognition as well as IgG, IgA, and IgE production, suggesting that this 'reverse signaling' modulates the CD154-dependent switching of B cells into the pool producing IgG, IgA, and IgE. By analysis of an interspecific backcross, Smith et al. (1993) mapped the Cd30l gene to the proximal region of mouse chromosome 4. These authors used fluorescence in situ hybridization to map the human CD30L gene to 9q33.

- [27115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [27116] Cerutti, A.; Schaffer, A.; Goodwin, R. G.; Shah, S.; Zan, H.; Ely, S.; Casali, P. : Engagement of CD153 (CD30 ligand) by CD30-positive T cells inhibits class switch DNA recombination and antibody production in human IgD-positive IgM-positive B cells. *J. Immun.* 165: 786–794, 2000. ; and
- [27117] Croager, E. J.; Abraham, L. J. : Characterisation of the human CD30 ligand gene structure. *Biochim. Biophys. Acta* 1353: 231–235, 1997.
- [27118] Further studies establishing the function and utilities of TNFSF8 are found in John Hopkins OMIM database record

ID 603875, and in cited publications numbered 7602–760 and 7607 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C motif) Ligand 1 (XCL1, Accession NM\_002995) is another VGAM655 host target gene. XCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XCL1 BINDING SITE, designated SEQ ID:8886, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27119] Another function of VGAM655 is therefore inhibition of Chemokine (C motif) Ligand 1 (XCL1, Accession NM\_002995), a gene which shows chemotactic activity for lymphocytes but not for monocytes or neutrophils. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XCL1. The function of XCL1 has been established by previous studies. Chemokines are a group of small (approximately 8 to 14 kD), mostly basic, structurally related molecules that regulate cell trafficking of

various types of leukocytes through interactions with a subset of 7-transmembrane G protein-coupled receptors. Chemokines also play fundamental roles in the development, homeostasis, and function of the immune system, and they have effects on cells of the central nervous system as well as on endothelial cells involved in angiogenesis or angiostasis. Chemokines are divided into 2 major subfamilies, CXC and CC, based on the arrangement of the first 2 of the 4 conserved cysteine residues; the 2 cysteines are separated by a single amino acid in CXC chemokines and are adjacent in CC chemokines. By screening a CD8<sup>+</sup> T-lymphocyte cDNA library with a mouse lymphotactin probe, Kennedy et al. (1995) isolated cDNAs encoding the lymphotactin XCL1, later designated SCYC1. The sequence of the deduced 114-amino acid protein is most homologous to the CC chemokines CCL8 and CCL3, but differs in that it lacks the first and third cysteines characteristic of CC and CXC chemokines. By Northern blot analysis, Kennedy et al. (1995) and Yoshida et al. (1995) revealed expression of an 0.8-kb SCYC1 transcript in activated thymic and peripheral blood CD8<sup>+</sup> but not CD4<sup>+</sup> T cells. In normal tissues, SCYC1 is expressed at high levels in spleen, thymus, small intestine,

and peripheral blood leukocytes, as well as at low levels in lung, prostate, and ovary; it shows little or no expression in colon and testis. Lymphotactin is chemotactic for CD4+ and CD8+ T cells but not for monocytes, and induces a rise in intracellular calcium in peripheral blood lymphocytes. Yoshida et al. (1995) and Muller et al. (1995) had identified the same sequence, termed SCM1 and ATAC, respectively, homologous to mouse lymphotactin, but were unable to demonstrate chemotaxis or calcium mobilization.

[27120] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27121] Kennedy, J.; Kelner, G. S.; Kleyensteuber, S.; Schall, T. J.; Weiss, M. C.; Yssel, H.; Schneider, P. V.; Cocks, B. G.; Bacon, K. B.; Zlotnik, A. : Molecular cloning and functional characterization of human lymphotactin. J. Immun. 155: 203–209, 1995. ; and

[27122] Yoshida, T.; Imai, T.; Kakizaki, M.; Nishimura, M.; Yoshie, O. : Molecular cloning of a novel C or gamma type chemokine, SCM–1. FEBS Lett. 360: 155–159, 1995.

[27123] Further studies establishing the function and utilities of XCL1 are found in John Hopkins OMIM database record ID

600250, and in cited publications numbered 7923–7928 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ12056

(Accession NM\_024933) is another VGAM655 host target gene. FLJ12056 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12056 BINDING SITE, designated SEQ ID:24468, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27124] Another function of VGAM655 is therefore inhibition of FLJ12056 (Accession NM\_024933). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12056. HTMP10 (Accession NM\_033207) is another VGAM655 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:27047, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27125] Another function of VGAM655 is therefore inhibition of HTMP10 (Accession NM\_033207). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTMP10. KIAA0125 (Accession NM\_014792) is another VGAM655 host target gene. KIAA0125 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0125 BINDING SITE, designated SEQ ID:16687, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27126] Another function of VGAM655 is therefore inhibition of KIAA0125 (Accession NM\_014792). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0125. KIAA0232 (Accession XM\_052627) is another

VGAM655 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36033, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27127] Another function of VGAM655 is therefore inhibition of KIAA0232 (Accession XM\_052627). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA0774 (Accession XM\_166270) is another VGAM655 host target gene. KIAA0774 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0774, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0774 BINDING SITE, designated SEQ ID:44088, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27128] Another function of VGAM655 is therefore inhibition of KIAA0774 (Accession XM\_166270). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0774. KIAA0847 (Accession XM\_085298) is another VGAM655 host target gene. KIAA0847 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0847 BINDING SITE, designated SEQ ID:38045, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27129] Another function of VGAM655 is therefore inhibition of KIAA0847 (Accession XM\_085298). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0847. SENP7 (Accession NM\_020654) is another VGAM655 host target gene. SENP7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SENP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SENP7 BINDING SITE, designated SEQ ID:21822, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27130] Another function of VGAM655 is therefore inhibition of SENP7 (Accession NM\_020654). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SENP7. LOC158886 (Accession XM\_096300) is another VGAM655 host target gene. LOC158886 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158886, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158886 BINDING SITE, designated SEQ ID:40311, to the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, also designated SEQ ID:3366.

[27131] Another function of VGAM655 is therefore inhibition of LOC158886 (Accession XM\_096300). Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158886. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 656 (VGAM656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[27132] VGAM656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM656 was detected is described hereinabove with reference to Figs. 1–8.

[27133] VGAM656 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[27134] VGAM656 gene encodes a VGAM656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM656 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM656 precursor RNA is designated SEQ ID:642, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:642 is located at position 77387 relative to the genome of Meleagrid Herpesvirus 1.

[27135] VGAM656 precursor RNA folds onto itself, forming VGAM656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[27136] An enzyme complex designated DICER COMPLEX, `dices` the VGAM656 folded precursor RNA into VGAM656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM656 RNA is designated SEQ ID:3367, and is provided hereinbelow with reference to the sequence listing part.

[27137] VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM656 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[27138] VGAM656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM656 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[27139] The complementary binding of VGAM656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM656 host target RNA into VGAM656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[27140] It is appreciated that VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM656 host target genes. The mRNA of each one of this plurality of VGAM656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM656 RNA, herein designated VGAM RNA, and which when bound by VGAM656 RNA causes in-

hibition of translation of respective one or more VGAM656 host target proteins.

[27141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM656 gene, herein designated VGAM GENE, on one or more VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[27142] It is yet further appreciated that a function of VGAM656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM656 include diagnosis, prevention and

treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM656 correlate with, and may be deduced from, the identity of the host target genes which VGAM656 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [27143] Nucleotide sequences of the VGAM656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM656 are further described hereinbelow with reference to Table 1.
- [27144] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM656 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [27145] As mentioned hereinabove with reference to Fig. 1, a function of VGAM656 gene, herein designated VGAM is inhibition of expression of VGAM656 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM656 correlate with, and may be deduced from, the identity of the target genes which VGAM656 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[27146] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM\_001748) is a VGAM656 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:7484, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27147] A function of VGAM656 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM\_001748). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM\_001933) is another VGAM656 host target gene. DLST BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DLST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLST BINDING SITE, designated SEQ ID:7645, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27148] Another function of VGAM656 is therefore inhibition of Dihydrolipoamide S-succinyltransferase (E2 component of 2-oxo-glutarate complex) (DLST, Accession NM\_001933), a gene which catalyzes the oxidative decarboxylation of alpha-keto acids. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLST. The function of DLST has been established by previous studies. The alpha-keto acid dehydrogenase complexes (pyruvate dehydrogenase complex, alpha-ketoglutarate dehydrogenase complex, and branched chain alpha-keto acid dehydrogenase complex) are a family of multienzyme complexes. They are localized in mitochondria and catalyze the oxidative decarboxylation of alpha-keto acids. These 3 alpha-keto acid dehydrogenase complexes are composed of

3 different enzymes: alpha-keto acid dehydrogenase (E1), dihydrolipoamide acyltransferase (E2), and dihydrolipoamide dehydrogenase (E3). Dihydrolipoamide succinyltransferase, which is a component of the structural core of the alpha-keto glutarate dehydrogenase complex, was studied by Nakano et al. (1993), who isolated a cDNA from a human fibroblast cDNA library. They found that the DLST gene contains 3 exons and 4 introns and that the nucleotide sequence at the 5-prime donor and 3-prime acceptor sites of all introns conformed to the gt-ag rule. Amino acid sequences of the 3 exons supported their previous observation (Nakano et al., 1993) that human dihydrolipoamide succinyltransferase lacks a sequence motif for an E1 (OMIM Ref. No. 312170) and/or E3 (OMIM Ref. No. 246900) binding site. By fluorescence in situ hybridization, they found that the DLST gene is located on 14q24.2-q24.3 and that a related sequence is located on 1p31. The gene for the dihydrolipoamide acyltransferase of the branched chain alpha-keto acid dehydrogenase complex (DBT; 248610), the site of the mutation in type 2 maple syrup urine disease, is located on 1p31. Nakano et al. (1993) mentioned the possibility that mutation of the DLST gene may be a cause of familial Alzheimer disease

that maps to 14q24.3 (AD3; 104311). Ali et al. (1994) mapped the DLST gene (symbolized by them KGDHC) to 14q24.3 by isotopic in situ hybridization. The cDNA they used also cross-hybridized to an apparent E2k pseudo-gene on 1p31. Northern analysis demonstrated that the gene is ubiquitously expressed in peripheral tissues and brain. Ali et al. (1994) mentioned Machado-Joseph disease as another candidate for mutation in the DLST gene. DLST is the E2 component of the alpha-ketoglutarate dehydrogenase complex. In contrast to the E2 components of the other 2 alpha-keto acid dehydrogenase complexes, the pyruvate dehydrogenase complex, and the branched-chain alpha-keto acid dehydrogenase complex, the alpha-KGDC E2 has a unique structure consisting of 2 domains and lacking a sequence motif of an E3 and/or E1 binding site (Patel and Harris, 1995).

[27149] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27150] Nakano, K.; Takase, C.; Sakamoto, T.; Ohta, S.; Nakagawa, S.; Ariyama, T.; Inazawa, J.; Abe, T.; Matuda, S. : An unspliced cDNA for human dihydrolipoamide succinyltransferase: characterization and mapping of the gene to chro-

mosome 14q24.2–q24.3. Biochem. Biophys. Res. Commun. 196: 527–533, 1993. ; and

[27151] Patel, M. S.; Harris, R. A. : Mammalian alpha-keto acid dehydrogenase complexes: gene regulation and genetic defects. FASEB J. 9: 1164–1172, 1995.

[27152] Further studies establishing the function and utilities of DLST are found in John Hopkins OMIM database record ID 126063, and in cited publications numbered 4003–4006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kelch-like 3 (Drosophila) (KLHL3, Accession XM\_113450) is another VGAM656 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42267, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27153] Another function of VGAM656 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM\_113450). Accordingly, utilities of VGAM656 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with KLHL3. LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM\_006055) is another VGAM656 host target gene.

LANCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12696, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27154] Another function of VGAM656 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM\_006055), a gene which binds the C-terminus of stomatin. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 has been established by previous studies. By affinity chromatography of solubilized human erythrocyte membrane proteins, Mayer et al. (1998) identified p40, a 40-kD protein that interacts with the C-

terminus of the membrane protein stomatin (OMIM Ref. No. 133090). They used the sequence of p40 peptides to identify partial cDNAs in an EST database, and then cloned cDNAs corresponding to the entire coding region using a PCR strategy. The predicted 399-amino acid protein contains the characteristic features of G protein-coupled receptors (GPCRs), including 7 transmembrane domains. Northern blot analysis revealed that p40 is expressed as a major 4.8-kb mRNA and as a minor 1.9-kb mRNA in all tissues. Dot blot experiments indicated that the highest levels of expression were in brain, spinal cord, testis, pituitary gland, and kidney. Using in situ hybridization to monkey tissues, Mayer et al. (1998) determined that p40 is expressed at high levels in neurons of the brain and spinal cord, in thymocytes, megakaryocytes, and macrophages. Bauer et al. (2000) determined that LANCL1 is not an integral membrane protein, but rather a weakly associated peripheral membrane protein, and is not a GPCR. They found that LANCL1 contains 7 highly conserved hydrophobic repeats and may play a role in peptide modification. Western blot analysis showed that LANCL1 is mainly expressed in brain, testis, ovary, and kidney. Mayer et al. (2001) determined that the human and mouse

LANCL1 genes span 45 kb and 38 kb, respectively, each comprising 10 exons

[27155] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27156] Bauer, H.; Mayer, H.; Marchler-Bauer, A.; Salzer, U.; Prohaska, R. : Characterization of p40/GPR69A as a peripheral membrane protein related to the lantibiotic synthetase component C. *Biochem. Biophys. Res. Commun.* 275: 69–74, 2000. ; and

[27157] Mayer, H.; Bauer, H.; Prohaska, R. : Organization and chromosomal localization of the human and mouse genes coding for LanC-like protein 1 (LANCL1). *Cytogenet. Cell Genet.* 93: 100–104.

[27158] Further studies establishing the function and utilities of LANCL1 are found in John Hopkins OMIM database record ID 604155, and in cited publications numbered 417–419 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mesoderm Specific Transcript Homolog (mouse) (MEST, Accession XM\_046001) is another VGAM656 host target gene. MEST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEST, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEST BINDING SITE, designated SEQ ID:34639, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27159] Another function of VGAM656 is therefore inhibition of Mesoderm Specific Transcript Homolog (mouse) (MEST, Accession XM\_046001), a gene which appears to be required for the appropriate immediate response of females to their pups. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEST. The function of MEST has been established by previous studies. The Mest gene maps to an imprinted region of mouse chromosome 6 and is expressed monoallelically from the paternal allele. When the null allele is paternally transmitted, the offspring exhibits severe intrauterine growth retardation. Uniparental disomy of mouse chromosome 6 is associated with a similar phenotype, presumably as a result of lack of expression of the Mest gene (Ferguson-Smith et al., 1991). The human homolog, MEST, maps to 7q31.3, within a region of conserved synteny corresponding to

mouse chromosome 6, and is monoallelically expressed from the paternal allele in a wide variety of tissues during prenatal and postnatal development. Uniparental disomy of chromosome 7 in humans is associated with phenotypic features of Silver–Russell syndrome (SRS; 180860), a heterogeneous disorder characterized by intrauterine and postnatal growth retardation, with or without additional dysmorphic features. Kotzot et al. (1995) predicted the presence of at least one maternally repressed gene on human chromosome 7, because they found maternal uniparental disomy for this chromosome in 4 of 35 patients with SRS. Nishita et al. (1996) suggested that MEST, the first imprinted gene to be identified on chromosome 7, is involved in the causation of this syndrome. Riesewijk et al. (1998) performed a mutation screen of the PEG1/MEST gene in 49 patients with SRS and 9 patients with primordial growth retardation (PGR). As background for this, they determined the complete genomic structure of the MEST gene, which comprises 12 exons. Apart from 1 silent mutation and 2 novel polymorphisms, nucleotide changes were not detected in any of the SRS or PGR patients. Moreover, methylation patterns of the 5–prime region of PEG1/MEST were found to be normal in 35 SRS and 9 PGR

patients and different from the pattern seen in patients with maternal uniparental disomy 7. Kobayashi et al. (2001) presented findings indicating that PEG1/MEST can be excluded as a major determinant of SRS. In a screening of 15 SRS patients, no aberrant expression patterns of 2 splice variants were detected in lymphocytes. Direct sequence analysis failed to detect any mutations in the coding region of isoform-1, which the authors called alpha, and there were no significant mutations in the 5-prime flanking upstream region containing the predicted promoter and the genomic region that is highly conserved between human and mouse. Differential methylation patterns of the CpG islands for the alpha isoform were normally maintained and resulted in the same patterns as in normal controls, suggesting that there was no loss of imprinting.

[27160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27161] Nishita, Y.; Yoshida, I.; Sado, T.; Takagi, N. : Genomic imprinting and chromosomal localization of the human MEST gene. Genomics 36: 539–542, 1996. ; and

[27162] Kobayashi, S.; Uemura, H.; Kohda, T.; Nagai, T.; Chinen,

Y.; Naritomi, K.; Kinoshita, E.; Ohashi, H.; Imaizumi, K.; Tsukahara, M.; Sugio, Y.; Tonoki, H.; Kishino, T.; Tanaka, T.; Yamada, M.

[27163] Further studies establishing the function and utilities of MEST are found in John Hopkins OMIM database record ID 601029, and in cited publications numbered 4307, 9967–9968, 9332, 9969–9972, 1024 and 10675–10677 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myosin X (MYO10, Accession NM\_012334) is another VGAM656 host target gene. MYO10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO10 BINDING SITE, designated SEQ ID:14732, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27164] Another function of VGAM656 is therefore inhibition of Myosin X (MYO10, Accession NM\_012334), a gene which is an unconventional myosin. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MYO10. The function of MYO10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Polymeric Immunoglobulin Receptor (PIGR, Accession XM\_052013) is another VGAM656 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:35937, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27165] Another function of VGAM656 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM\_052013). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM\_013385) is another VGAM656 host target gene. PSCD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD4,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD4 BINDING SITE, designated SEQ ID:15035, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27166] Another function of VGAM656 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM\_013385), a gene which promotes guanine-nucleotide exchange on arf1 and arf5. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSCD4. The function of PSCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM615. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517) is another VGAM656 host target gene. SLC16A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A2 BINDING SITE, designated SEQ ID:13271, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27167] Another function of VGAM656 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 2 (putative transporter) (SLC16A2, Accession NM\_006517). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A2. Stress 70 Protein Chaperone, Microsome-associated, 60kDa (STCH, Accession NM\_006948) is another VGAM656 host target gene. STCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STCH BINDING SITE, designated SEQ ID:13835, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27168] Another function of VGAM656 is therefore inhibition of Stress 70 Protein Chaperone, Microsome-associated,

60kDa (STCH, Accession NM\_006948), a gene which has peptide-independent atpase activity. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STCH. The function of STCH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM550. Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056) is another VGAM656 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6722, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27169] Another function of VGAM656 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1.

Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445) is another VGAM656 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:22781, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27170] Another function of VGAM656 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHAE, Accession NM\_006761) is another VGAM656 host target gene.

YWHAЕ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAЕ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAЕ BINDING SITE, designated SEQ ID:13612, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27171] Another function of VGAM656 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHAЕ, Accession NM\_006761), a gene which binds to cdc25 and may facilitate cdc25 interaction with Raf-1 in vivo. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAЕ. The function of YWHAЕ has been established by previous studies. Using a yeast 2-hybrid screen to probe a HeLa cell library with CDC25A (OMIM Ref. No. 116947) and CDC25B (OMIM Ref. No. 116949) as bait, Conklin et al. (1995) isolated cDNAs encoding YWHAB (OMIM Ref. No. 601289), which they called 14-3-3-beta, and YWHAЕ, which they called

14-3-3-epsilon. YWHAE encodes a deduced 260-amino acid protein that is 100% identical to the mouse sequence. Both 14-3-3 proteins interacted with either CDC protein but did not affect their phosphatase activities. Like YWHAB, YWHAE interacted with RAF1 (OMIM Ref. No. 164760) but not RAS (OMIM Ref. No. 190020) in yeast 2-hybrid screens and may facilitate the association of CDC25 with RAF1. The binding of insulin (OMIM Ref. No. 176730) to its receptor induces the phosphorylation of the cytosolic substrates IRS1 (OMIM Ref. No. 147545) and IRS2 (OMIM Ref. No. 600797), which associate with several Src homology-2 (SH2) domain-containing proteins. To identify unique IRS1-binding proteins, Ogihara et al. (1997) screened a human heart cDNA expression library with recombinant IRS1. They obtained 2 isoforms of the 14-3-3 protein family, 14-3-3-zeta (YWHAZ; 601288) and -epsilon. 14-3-3 protein has been shown to associate with IRS1 in L6 myotubes, HepG2 hepatoma cells, Chinese hamster ovary cells, and bovine brain tissue. IRS2, a protein structurally similar to IRS1, was also shown to form a complex with 14-3-3 protein using a baculovirus expression system. The amount of 14-3-3 protein associated with IRS1 was not affected by insulin stimulation but

was increased significantly by treatment with okadaic acid, a potent serine/threonine phosphatase inhibitor. The authors identified a putative 14-3-3 protein-binding site within the phosphotyrosine-binding (PTB) domain of IRS1. Ogihara et al. (1997) suggested that the association with 14-3-3 protein may play a role in the regulation of insulin sensitivity by interrupting the association between the insulin receptor and IRS1.

[27172] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[27173] Conklin, D. S.; Galaktionov, K.; Beach, D. : 14-3-3 proteins associate with cdc25 phosphatases. Proc. Nat. Acad. Sci. 92: 7892-7896, 1995. ; and

[27174] Ogihara, T.; Isobe, T.; Ichimura, T.; Taoka, M.; Funaki, M.; Sakoda, H.; Onishi, Y.; Inukai, K.; Anai, M.; Fukushima, Y.; Kikuchi, M.; Yazaki, Y.; Oka, Y.; Asano, T. : 14-3-3 protein bin.

[27175] Further studies establishing the function and utilities of YWHAЕ are found in John Hopkins OMIM database record ID 605066, and in cited publications numbered 6799-6800, 10093-680 and 4469 listed in the bibliography section hereinbelow, which are also hereby incorpo-

rated by reference. Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144) is another VGAM656 host target gene. ZNF144 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF144 BINDING SITE, designated SEQ ID:13989, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27176] Another function of VGAM656 is therefore inhibition of Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144), a gene which is a transcriptional repressor and may play a role in the control of cell proliferation. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF144. The function of ZNF144 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM380. Apolipoprotein L, 4 (APOL4, Accession NM\_030643) is another VGAM656 host target gene. APOL4 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by APOL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:24977, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27177] Another function of VGAM656 is therefore inhibition of Apolipoprotein L, 4 (APOL4, Accession NM\_030643). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4. Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM\_014145) is another VGAM656 host target gene. C20orf30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf30 BINDING SITE, designated SEQ ID:15432, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27178] Another function of VGAM656 is therefore inhibition of Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM\_014145). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf30.

FLJ12985 (Accession NM\_024924) is another VGAM656 host target gene. FLJ12985 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12985 BINDING SITE, designated SEQ ID:24462, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27179] Another function of VGAM656 is therefore inhibition of FLJ12985 (Accession NM\_024924). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12985. KIAA0179 (Accession XM\_035973) is another VGAM656 host target gene. KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:32364, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27180] Another function of VGAM656 is therefore inhibition of KIAA0179 (Accession XM\_035973). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA1877 (Accession XM\_038616) is another VGAM656 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32878, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27181] Another function of VGAM656 is therefore inhibition of KIAA1877 (Accession XM\_038616). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1877. PRO0767 (Accession NM\_014083) is another VGAM656 host target gene. PRO0767 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0767 BINDING SITE, designated SEQ ID:15309, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27182] Another function of VGAM656 is therefore inhibition of PRO0767 (Accession NM\_014083). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0767. Serine Protease Inhibitor-like, with Kunitz and WAP Domains 1 (eppin) (SPINLW1, Accession NM\_020398) is another VGAM656 host target gene. SPINLW1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPINLW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPINLW1

BINDING SITE, designated SEQ ID:21665, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27183] Another function of VGAM656 is therefore inhibition of Serine Protease Inhibitor-like, with Kunitz and WAP Domains 1 (eppin) (SPINLW1, Accession NM\_020398). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPINLW1. LOC138307 (Accession XM\_059963) is another VGAM656 host target gene. LOC138307 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138307 BINDING SITE, designated SEQ ID:37122, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27184] Another function of VGAM656 is therefore inhibition of LOC138307 (Accession XM\_059963). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC138307. LOC144182 (Accession NM\_139136) is another VGAM656 host target gene. LOC144182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144182 BINDING SITE, designated SEQ ID:29166, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27185] Another function of VGAM656 is therefore inhibition of LOC144182 (Accession NM\_139136). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144182. LOC149734 (Accession XM\_097713) is another VGAM656 host target gene. LOC149734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149734 BINDING SITE, designated SEQ ID:41054, to the nucleotide sequence of VGAM656 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3367.

[27186] Another function of VGAM656 is therefore inhibition of LOC149734 (Accession XM\_097713). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149734. LOC157983 (Accession XM\_088433) is another VGAM656 host target gene. LOC157983 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157983, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157983 BINDING SITE, designated SEQ ID:39687, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27187] Another function of VGAM656 is therefore inhibition of LOC157983 (Accession XM\_088433). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157983. LOC158857 (Accession XM\_098997) is another VGAM656 host target gene. LOC158857 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158857, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158857 BINDING SITE, designated SEQ ID:42030, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27188] Another function of VGAM656 is therefore inhibition of LOC158857 (Accession XM\_098997). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158857. LOC159049 (Accession XM\_099020) is another VGAM656 host target gene. LOC159049 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159049, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159049 BINDING SITE, designated SEQ ID:42056, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27189] Another function of VGAM656 is therefore inhibition of LOC159049 (Accession XM\_099020). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC159049. LOC168283 (Accession XM\_094966) is another VGAM656 host target gene. LOC168283 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC168283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168283 BINDING SITE, designated SEQ ID:40240, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27190] Another function of VGAM656 is therefore inhibition of LOC168283 (Accession XM\_094966). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168283. LOC203289 (Accession XM\_114672) is another VGAM656 host target gene. LOC203289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203289 BINDING SITE, designated SEQ ID:43029, to

the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.

[27191] Another function of VGAM656 is therefore inhibition of LOC203289 (Accession XM\_114672). Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203289. LOC203378 (Accession XM\_117541) is another VGAM656 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43545, to the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, also designated SEQ ID:3367.
